

1 Kernels

1. let $(x, y) \in \mathbb{R}^+ \times \mathbb{R}^+$, where $\mathbb{R}^+ = \{x \in \mathbb{R}; x \geq 0\}$, the “french positive” real numbers.

(a) Verify that $\min(x, y) = \int_0^\infty \mathbb{I}_{t \leq x} \mathbb{I}_{t \leq y} dt$ where $\mathbb{I}_A = \begin{cases} 1 & \text{if } A \text{ is true} \\ 0 & \text{otherwise} \end{cases}$

When $x \leq y$,

$$\begin{aligned} \int_0^\infty \mathbb{I}_{t \leq x} \mathbb{I}_{t \leq y} dt &= \int_0^x \mathbb{I}_{t \leq x} \mathbb{I}_{t \leq y} dt + \int_x^y \mathbb{I}_{t \leq x} \mathbb{I}_{t \leq y} dt + \int_y^\infty \mathbb{I}_{t \leq x} \mathbb{I}_{t \leq y} dt \\ &= \int_0^x 1 \cdot 1 dt + \int_x^y 0 \cdot 1 dt + \int_y^\infty 0 \cdot 0 dt = x \end{aligned}$$

By the same way, when $y \leq x$, $\int_0^\infty \mathbb{I}_{t \leq x} \mathbb{I}_{t \leq y} dt = y$.

Therefore, $\min(x, y) = \int_0^\infty \mathbb{I}_{t \leq x} \mathbb{I}_{t \leq y} dt$

(b) Use the previous question to show that $K(x, y) = \min(x, y)$ is a pd kernel over \mathbb{R}^+

$K(x, y) = \min(x, y) = \int_0^\infty \mathbb{I}_{t \leq x} \mathbb{I}_{t \leq y} dt = \min(y, x) = K(y, x)$ symmetric

$$\sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j \min(x, y) = \int_0^\infty \sum_{i=1}^n \alpha_i \mathbb{I}_{t \leq x} \sum_{j=1}^n \alpha_j \mathbb{I}_{t \leq y} dt = \int_0^\infty \left(\sum_{i=1}^n \alpha_i \mathbb{I}_{t \leq x} \right)^2 dt \geq 0$$

(c) Show that $\max(x, y)$ is not a pd kernel over \mathbb{R}^+ .

Let $x_1 = 1, x_2 = 2, \alpha_1 = 1, \alpha_2 = -1$

$$\sum_{i=1}^2 \sum_{j=1}^2 \alpha_i \alpha_j k(x_i, x_j) = \alpha_1 \alpha_1 \max(1, 1) + \alpha_1 \alpha_2 \max(1, 2) + \alpha_2 \alpha_1 \max(2, 1) + \alpha_2 \alpha_2 \max(2, 2) = 1 - 2 - 2 + 2 = -1 < 0$$

Therefore, $\max(x, y)$ is not a p.d. kernel over \mathbb{R}^+

2. Consider a probability space (Ω, \mathcal{A}, P)

(a) Define for any two events A and B , $K_1(A, B) = P(A \cap B)$ where $A \cap B$ is the intersection between the events A and B . Verify that K_1 is positive definite. Hint: $P(A) = E[\mathbb{I}_A]$

$K_1(A, B) = P(A \cap B) = P(B \cap A) = K_1(B, A)$ symmetric

$P(A) = E[\mathbb{I}_A]; P(B) = E[\mathbb{I}_B]; P(A \cap B) = E[\mathbb{I}_A \mathbb{I}_B]$

$$\sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j E[\mathbb{I}_{A_i} \mathbb{I}_{A_j}] = E\left[\sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j \mathbb{I}_{A_i} \mathbb{I}_{A_j}\right] = E\left[\left(\sum_{i=1}^n \alpha_i \mathbb{I}_{A_i}\right)^2\right] \geq 0$$

(b) Define for any two events A and B , $K_2(A, B) = P(A \cap B) - P(A)P(B)$. Verify that K_2 is positive definite.

$$K_2(A, B) = P(A \cap B) - P(A)P(B) = E[\mathbb{I}_A \mathbb{I}_B] - E[\mathbb{I}_A]E[\mathbb{I}_B] = Cov[\mathbb{I}_A, \mathbb{I}_B]$$

$$\sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j Cov[\mathbb{I}_{A_i}, \mathbb{I}_{A_j}] = Cov\left[\sum_{i=1}^n \alpha_i \mathbb{I}_{A_i}, \sum_{j=1}^n \alpha_j \mathbb{I}_{A_j}\right] = Var\left[\sum_{i=1}^n \alpha_i \mathbb{I}_{A_i}\right] \geq 0$$

2 Kernels and RKHS

1. Define the RKHS over \mathbb{R}^d $K(x, y) = x^T y + c$ where $c > 0$.

- (a) What is the RKHS associated with the kernel K ? no proof is required.

$$\mathcal{H} = \{f : \mathbb{R}^d \mapsto \mathbb{R}; f_{w, w_0}(x) = w^T x + w_0; \quad w \in \mathbb{R}^d, w_0 \in \mathbb{R}\}$$

- (b) What is the inner product in this RKHS? no proof required.

$$\langle f_{v, v_0}, f_{w, w_0} \rangle_{\mathcal{H}} = v^T w + \frac{1}{c} v_0 w_0 \Rightarrow \langle f_{v, v_0}, f_{v, v_0} \rangle = \|f_{v, v_0}\|_{\mathcal{H}}^2 = \|v\|^2 + \frac{v_0^2}{c}$$

- (c) Verify the reproducing property

$$\mathcal{H} \text{ contains all the functions } k(\cdot, x) : t \mapsto k(t, x) = t^T x + c = f_t(x)$$

$$\langle f_{w, w_0}, k(\cdot, x) \rangle = \langle f_{w, w_0}, f_{x, c} \rangle = x^T w + \frac{1}{c} c w_0 = w^T x + w_0 = f_w(x)$$

$$\therefore \langle f, k(\cdot, x) \rangle_{\mathcal{H}} = f(x) \text{ for each } f \in \mathcal{H}, x \in \mathcal{X}$$

2. Define the RKHS over \mathbb{R}^d $K(x, y) = (x^T y)^2$ The RKHS associated with the kernel K is $\{f_S; f_S(x) = x^T S x\}$ where S is a symmetric (d, d) matrix. The inner product is $\langle f_{S_1}, f_{S_2} \rangle = \langle S_1, S_2 \rangle_F$

- (a) Verify the reproducing property.

$$\mathcal{H} \text{ contains all the functions } k(\cdot, x) : t \mapsto k(t, x) = (t^T x)(t^T x) = x^T \cdot (t t^T) \cdot x = f_t(x)$$

$$\langle f_S, k(\cdot, x) \rangle_{\mathcal{H}} = \langle f_S, f_{x x^T} \rangle_{\mathcal{H}} = \langle S, x x^T \rangle_{\mathcal{F}} = \text{trace}[S x x^T] = \text{trace}[x^T S x] = x^T S x = f_S(x)$$

$$\therefore \langle f_S, k(\cdot, x) \rangle_{\mathcal{H}} = f_S(x) \text{ for each } f \in \mathcal{H}, x \in \mathcal{X}$$

- (b) Why do we require that S is symmetric?

$k(x, y) = (x^T y)^2$ is a p.d. kernel. $\langle f_S, k(\cdot, x) \rangle_{\mathcal{H}} = f_S(x) = x^T S x$ is a quadratic form over \mathbb{R}^d , where x is the column vector and S must be a symmetric $n \times n$ matrix by the definition of quadratic form.

3. Define the RKHS over \mathbb{R}^d $K(x, y) = (x^T y + c)^2$ where $c > 0$.

- (a) What is the RKHS associated with the kernel K ? no proof is required.

$$\{f_{S, s, s_0} : f_{S, s, s_0}(x) = x^T S x + 2s_0 s^T x + s_0^2; \quad S \in \mathbb{R}^{d \times d}, s \in \mathbb{R}^d, s_0 \in \mathbb{R}\}$$

- (b) What is the inner product in this RKHS? no proof required.

$$\langle f_{S_1, s_1, s_{10}}, f_{S_2, s_2, s_{20}} \rangle_{\mathcal{H}} = \langle S_1, S_2 \rangle_{\mathcal{F}} + \frac{2s_{10}s_{20}}{c} s_1^T s_2 + \left(\frac{s_{10}s_{20}}{c}\right)^2$$

- (c) Verify the reproducing property

$$\mathcal{H} \text{ contains all the functions } k(\cdot, x_i) : t \mapsto k(t, x) = (t^T x + c)^2 = x^T \cdot (t t^T) \cdot x + 2c t^T x + c^2 = f_t(x)$$

$$\begin{aligned} \langle f_{S, s, s_0}, k(\cdot, x) \rangle_{\mathcal{H}} &= \langle f_{S, s, s_0}, f_{x x^T, x, c} \rangle_{\mathcal{H}} = \langle S, x x^T \rangle_{\mathcal{F}} + \frac{2s_0 c}{c} s^T x + \left(\frac{s_0 c}{c}\right)^2 \\ &= x^T S x + 2s_0 s^T x + s_0^2 = f_{S, s, s_0}(x) \end{aligned}$$

$$\therefore \langle f_{S, s, s_0}, k(\cdot, x) \rangle_{\mathcal{H}} = f_{S, s, s_0}(x) \text{ for each } f \in \mathcal{H}, x \in \mathcal{X}$$

3 Fisher kernel

Let $\theta \in \mathbb{R}$ be a parameter and let p_θ be a probabilistic model (i.e a point mass function or a density) over a set \mathcal{X} indexed by θ . Let $\theta_0 \in \mathbb{R}$ be a specific value for θ . Let us define the Fisher score at $x \in \mathcal{X}$ as $\phi(x, \theta_0) = \frac{\delta}{\delta \theta} \ln p_\theta(x)$ evaluated at $\theta = \theta_0$ assuming that this quantity exists. Define $I(\theta)$, the Fisher information associated with the parameter θ , i.e., $I(\theta) = E[\phi^2(X, \theta)]$ where E stands for expectation and X is a random variable with distribution p_θ . The Fisher kernel is then $k(x, x') = \frac{\phi(x, \theta_0)\phi(x', \theta_0)}{I(\theta_0)}$ where

1. Verify that $k(., .)$ is a positive definite kernel over \mathcal{X}

$$k(x, x') = \frac{\phi(x, \theta_0)\phi(x', \theta_0)}{I(\theta_0)} = \frac{\phi(x', \theta_0)\phi(x, \theta_0)}{I(\theta_0)} = k(x', x) \text{ symmetric.}$$

For $I(\theta) = E[\phi^2(X, \theta)] \geq 0$,

$$k(x, x') = \frac{1}{I(\theta_0)} \sum_{i=1}^n \alpha_i \phi(x_i, \theta_0) \sum_{j=1}^n \alpha_j \phi(x_j, \theta_0) = \frac{1}{I(\theta_0)} [\sum_{i=1}^n \alpha_i \phi(x_i, \theta_0)]^2 \geq 0$$

$\therefore k(., .)$ is a positive definite kernel over \mathcal{X}

2. Consider the following model: $x \in \{0, 1\}$, $X \sim \text{Bernoulli}(\theta)$, $0 < \theta < 1$, that is $p_\theta(x) = \theta^x(1-\theta)^{(1-x)}$
We recall that in this case $E[X] = \theta$ and $\text{Var}[X] = E[(X - \theta)^2] = \theta(1 - \theta)$ Compute $k(x, x')$

$$p_\theta(x) = \theta^x(1 - \theta)^{(1-x)}$$

$$\ln p_\theta(x) = x \ln \theta + (1 - x) \ln(1 - \theta)$$

$$\frac{d}{d\theta} \ln p_\theta(x) = \frac{x}{\theta} + \frac{1-x}{1-\theta} = \frac{x-\theta}{\theta(1-\theta)}$$

$$I(\theta) = E[\phi^2(X, \theta)] = E\left[\left(\frac{X-\theta}{\theta(1-\theta)}\right)^2\right] = \frac{E[(X-\theta)^2]}{\theta^2(1-\theta)^2} = \frac{V[X]}{\theta^2(1-\theta)^2} = \frac{\theta(1-\theta)}{\theta^2(1-\theta)^2} = \frac{1}{\theta(1-\theta)}$$

$$k(x, x') = \frac{\phi(x, \theta_0)\phi(x', \theta_0)}{I(\theta_0)} = \frac{(x-\theta_0)(x'-\theta_0)}{\theta_0^2(1-\theta_0)^2} \theta_0(1-\theta_0) = \frac{(x-\theta_0)(x'-\theta_0)}{\theta_0(1-\theta_0)} \quad \square$$

3. Assume now $x = (x_1, x_2)$ with $x_1 \in \{0, 1\}$ and $x_2 \in \{0, 1\}$. We consider the following model where $X = (X_1, X_2)$, X_1 and X_2 are independent with the same $\text{Bernoulli}(\theta)$ distribution. Compute $k(x, x')$.

$$p_\theta(\vec{x})_{x_1 \perp x_2} = p_\theta(x_1)p_\theta(x_2) = \theta^{x_1+x_2}(1-\theta)^{2-x_1-x_2}$$

$$\ln p_\theta(x) = (x_1 + x_2) \ln \theta + (2 - x_1 - x_2) \ln(1 - \theta)$$

$$\phi(\vec{x}, \theta) = \frac{d}{d\theta} \ln p_\theta(x) = \frac{x_1 + x_2}{\theta} + \frac{2 - x_1 - x_2}{1 - \theta} = \frac{x_1 + x_2 - 2\theta}{\theta(1 - \theta)}$$

$$\begin{aligned} I(\theta) &= E[\phi^2(\vec{X}, \theta)] = \frac{E[(X_1 + X_2 - 2\theta)^2]}{\theta^2(1 - \theta)^2} \\ &= \frac{E[(X_1 - \theta)^2] + E[(X_2 - \theta)^2] + 2(E[X_1] - \theta)(E[X_2] - \theta)}{\theta^2(1 - \theta)^2} \\ &= \frac{V[X_1] + V[X_2] - 0}{\theta^2(1 - \theta)^2} = \frac{2\theta(1 - \theta)}{\theta^2(1 - \theta)^2} = \frac{2}{\theta(1 - \theta)} \end{aligned}$$

$$\begin{aligned} k(x, x') &= \frac{\phi(\vec{x}, \theta_0)\phi(\vec{x}', \theta_0)}{I(\theta_0)} = \frac{(x_1 + x_2 - 2\theta_0)(x'_1 + x'_2 - 2\theta_0)}{\theta_0^2(1 - \theta_0)^2} \frac{\theta_0(1 - \theta_0)}{2} \\ &= \frac{(x_1 + x_2 - 2\theta_0)(x'_1 + x'_2 - 2\theta_0)}{2\theta_0(1 - \theta_0)} \quad \square \end{aligned}$$
