Let  $X_1, X_2, \dots, X_n$  be a random sample of size  $n$  from a probability density function  $f(x; \theta) = \begin{cases} (\theta + 1)x^\theta & 0 < x < 1 \\ 0 & o.w. \end{cases}$  where  $\theta > -1$  is an unknown parameter.

- Find  $\hat{\theta}$ , the maximum likelihood estimator of  $\theta$ .
- Using  $\hat{\theta}$ , create an unbiased estimator  $\hat{\theta}_U$  of  $\theta$ .
- Find the Cramer-Rao lower bound for an unbiased estimator of  $\theta$ .
- What is the asymptotic distribution of  $\hat{\theta}$ ?

## 2010S

### 2010SA1

2008F2 2014F2A

Only 1 in 1000 adults is afflicted with a rare disease for which a diagnostic test has been developed. The test is such that when an individual actually has the disease, a positive result will occur 99% of the time, whereas an individual without the disease will show a positive result only 2% of the time (false positive). If a randomly selected individual is tested and the result is positive, what is the probability that the individual has the disease?

 Let  $U_1, U_2, \dots, U_n$  be iid *uniform*[0,1] random variables. Let  $0 \leq Y_1 < Y_2 < \dots < Y_n$  be the corresponding order statistics, ie,  $Y_k$  is the  $k^{th}$  smallest of the  $U_i$  What is the joint pdf of  $Y_1, Y_2, \dots, Y_n$ ? Find the marginal pdf of  $Y_k$ , where  $1 \leq k \leq n$ . Find the mean and variance of  $Y_k$ .  
 $\sim Beta(k, n - k + 1)$

### 2014SA5

2005S8 2014SA3 2015S3A 2016S3  
 Assume that  $Z$  is a standard normal or  $N(0,1)$  random variable. Find a formula for  $E[Z^k]$  where  $k$  is a positive integer.

### 2014SB1

Expo [lifetime]  
 The lifetime (in hours)  $X$  of an electronic component is tt random variable with cumulative distribution functionfundion  

$$F(y) = \begin{cases} 1 - e^{-y/5} & y > 0 \\ 0 & o.w. \end{cases}$$
 (a) What is the probability that a randomly selected component will operate for at least 10 hours?  
 $1/e^2$   
 (b) What is the probability that the lifetime of a randmnly selected component will exceed its mean lifetime by more than two standard deviations?  
 $P(Y > 5 + 2 \times 5)$   
 (c) Three of these components operate independently in a piece of equipment. The equipment fails if at least two of the components fail. Find the probability that the equipment will operate for at least 10 hours without failure?  
 $Bino(p = 1 - e^{-2})$

### 2014SB2

2008S4B  
 Let  $X_1, X_2, \dots, X_{10}$  be random variables denoting 10 independent bids for an item that is for sale. Suppose that each  $X_i$  is uniformly distributed on the interval  $[\theta - 50, \theta + 50]$ , where  $\theta > 100$ . The seller sells to the highest bidder, how much can he expect to earn on the sale?

### 2014SB3

2014F4B MLE  
 Let  $X_1, X_2, \dots, X_n$  be a random sample from a normal distribution,  $N(\mu, \sigma^2)$ , where  $-\infty < \mu < +\infty$  and  $\sigma > 0$ . Find the MLE of  $\mu/\sigma$  and find itsexpected value.

### 2014SB4

CRLB [7.E.12]  
 Suppose  $X_1, X_2, \dots, X_n$  is a random sample from a population with probability mass function  
 $p_\theta(X = x) = \theta^x(1 - \theta)^{1-x}, x = 0, 1; 0 < \theta < 1$   
 (a) Find the maximrn likelihood estimator of  $Var_\theta(X) = \theta(1 - \theta)$ .  
 (b) Find the the Cramer-Rao lower bound for the variance of any unbiased estimator of  $\theta(1 - \theta)$ .  
 $\frac{(1-2\theta)^2(\theta-\theta^2)}{n}$

### 2014SB5

BayesE MLE  
 Suppose  $X$  has Binomial distribution with pararneters  $n$  and  $\theta, 0 < \theta < 1$ .

(a) Find the Bayes estimator of  $\theta$  when the prior distribution is uniform on the interval  $(0, 1)$  and the loss function is square error loss function.  
 $\pi(\theta) \sim Unif(0, 1); f(x|\theta) = \binom{n}{x}\theta^x(1 - \theta)^{n-x}$   
 $\pi(\theta|x) = \frac{f(x|\theta)\pi(\theta)}{f(x)} \propto \frac{\binom{n}{x}\theta^x(1-\theta)^{n-x}}{\int_0^1 f(x|\theta)d\theta} \propto \frac{(n+1)!}{x!(n-x)!}\theta^x(1 - \theta)^{n-x} \sim Beta(x + 1, n - x + 1)$   
 $\hat{\theta} = \frac{\alpha}{\alpha + \beta} = \frac{x+1}{n+2}$   
 (b) Compare the risk of the above Bayes estimator with that of the MLE of  $\theta$ .  
 $\hat{\theta}_{MLE} = \bar{X}$   
 $Risk(\theta, \delta) = E_\theta[Loss(\theta, \delta(x))] = Var[\delta(x)] + E_\theta[\delta(x)]^2 =$   
 $Var[\delta(x)] + Bias^2[\delta(x)] = \frac{n\theta(1-\theta)}{(n+2)^2} + \frac{(1+2\theta)^2}{(n+2)^2}$   
 $ARE = \frac{Var[\hat{\theta}_{MLE}]}{Var[\hat{\theta}_B]} = \frac{VarX/n^2}{VarX/(n+1)^2} = \frac{(n+1)^2}{n^2} > 1$

## 2014F

### 2014F1A

Repeat a sequence of i.i.d. Bernoulli trials until you observe the frst success, where  $p$  = the probability of a success and  $q = 1 - p$  = the probability of a failure on any one trial. Let the random variable  $Y$  count the number of failures before the frst success.  
 (a) State the name of this statistical experiment.  
 (b) Provide a mathematical formula for the probability mass function,  $P(Y = y)$  where  $y = ?$ .  
 (c) Give in closed form the  $P(Y \geq y)$ .  
 (d) Determine the  $E(Y)$ .  
 (e) Derive the moment generating function (M.G.F.) of  $Y$  . Remember to state the interval over which this M.G.F. exists.

### 2014F2A

2008F2 2010SA1 [561-fe6]  
 One percent of all individuals in a certain population are carriers of a particular disease. A diagnostic test for this disease has a 90% detection rate for carriers and a 5% detection rates for noncarriers. Suppose the test is applied independently to two different blood samples from the same randomly selected individual.  
 (a) What is the probability that both tests yield the same result?  
 $0.01 \times 0.9 + 0.99 \times 0.95 = 0.9495$   
 (b) If both tests are positive, what is the probability that the selected individual is a carrier?  
 $P(c|p) = \frac{P(p|c)P(c)}{P(p|c)P(c) + P(p|non)P(non)} = 2/13$

### 2014F3A

2013S2  
 Suppose  $X_1$  and  $X_2$  are i.i.d. random variables and the p.d.f. of each of them is as follows:  $f(x) = \begin{cases} e^{-x} & x \geq 0 \\ 0 & o.w. \end{cases}$   
 (a) Find the p.d.f. of  $Y = 4(X_1 - X_2)$ .  
 (b) Find the mean and variance of  $Y$ .

### 2014F4A

2007F2A 2008S5A 2009FA1 2015S2A 2019SA2  
 The lifetime (in hours)  $Y$  of an electronic component is a random variable with density function  $f(y) = \begin{cases} \frac{1}{300}e^{-\frac{1}{300}y} & y > 0 \\ 0 & o.w. \end{cases}$   
 (a) What is the probability that a randomly selected component will operate for at least 300 hours?  
 (b) Five of these components operate independently in a piece of equipment. The equipment fails if at least three of the components fail.  
 Find the probability that the equipment will operate for at least 300 hours without failure?

### 2014F5A

2004F10  
 Let  $Z_1, Z_2, \dots$  be a sequence of random variables random variables; and suppose that, for  $n = 1, 2, \dots$ , the distribution of  $Z_n$  is given by  $P(Z_n = n^2) = 1/n$  and  $P(Z_n = 0) = 1 - 1/n$ . Show that  $\lim_{n \rightarrow \infty} E(Z_n) = \infty$  but  $Z_n \xrightarrow{P} 0$  as  $n \rightarrow \infty$

## 2014F1B

2007F5A, 2013FB2, 2015S1B MLE

Let  $X_1, X_2, \dots, X_n$  be a random sample from a distribution with cu-

$$\text{mulative distribution function } F(x) = \begin{cases} 0 & x < 0 \\ (\frac{x}{\theta})^2 & 0 \leq x < \theta \\ 1 & x \geq \theta \end{cases}$$

- Find the MLE  $\hat{\theta}$  of  $\theta$ .
- Prove that  $\hat{\theta}$  is consistent for  $\theta$ .
- Find a 95% confidence interval for  $\theta$  when  $n = 6$ .

## 2014F2B

2008S2B FishI

Let  $X_1, X_2, \dots, X_n$  denote a random sample from a Poisson distribution with mean  $\theta, \theta > 0$ .

- Find the Fisher information about  $\theta$  in the sample.
- Suppose we want to estimate  $m(\theta) = P(X_1 = 0) = e^{-\theta}$ . Find a lower bound on the variance of any unbiased estimator of the parametric function  $m(\theta)$ .

## 2014F3B

UMP HypoT power

Let  $\theta$  be a parameter with space  $\Omega = \{0, 1\}$ . Let  $X$  be a discrete random variable taking on values 1, 2, 3, or 4. Let the probability function of  $X$  be given by the following table:

$X_1, X_2, X_3, X_4$
$\theta_0$ 1/2, 1/4, 1/8, 1/8
$\theta_1$ 2/9, 2/9, 2/9, 1/3

Find the UMP size 1/8 and 1/4 tests to test  $H_0 : \theta = 0$  against  $H_A : \theta = 1$ . Also find the powers of these two tests.

## 2014F4B

2014SB3 MLE

Let  $X_1, X_2, \dots, X_n$  be a random sample from a normal distribution,  $N(\mu, \sigma^2)$ , where  $-\infty < \mu < +\infty$  and  $\sigma > 0$ . Find the MLE of  $\mu/\sigma$  and find its expected value.

## 2014F5B

2007F2B, 2017FB2 Expo suff [6.E.30] [562-fe]

Let  $X_1, X_2, \dots, X_n$  denote a random sample from exponential distribution with pdf,  $f(x, \mu) = \begin{cases} e^{-(x-\mu)} & \mu < x < \infty \\ 0 & e.w. \end{cases}$

- Show that  $X_{(1)} = \min\{X_i\}$  is a complete sufficient statistic.

$$f_{X_{(1)}}(x) = nf(x)[1 - F(x)]^{n-1} = ne^{n\mu}e^{-nx}$$

$$0 = E[g(T)] = ne^{n\mu} \int_{\mu}^{\infty} g(x)e^{-nx} dx$$

$$P(g(T) = 0) = 1, X_{(1)} \text{ is compl/suffi}$$

- Are  $X_{(1)}$  and the sample variance independent statistics? Justify your answer.

$\frac{f(x|\mu)}{f(y|\mu)}$  is constant, iff  $X_{(1)} = Y_{(1)}$ ,  $X_{(1)}$  is minimal suffi

$$S^2 = \frac{1}{n-1} \sum (x_i - \bar{x})^2 = \frac{1}{n-1} \sum ((x_i - \mu) - (\bar{x} - \mu))^2 = \frac{1}{n-1} \sum (z_i - \bar{z})^2 \text{ is free of } \mu, \text{ is ancillary.}$$

Ancillary  $S^2$  and minimal suffi  $X_{(1)}$  are indep

## 2016S1

[Pois]

Let  $X_1, X_2, \dots, X_n$  be iid (independent, identically distributed) Poisson random variables with parameter  $\lambda > 0$ .

(a) Find a complete sufficient statistic for  $\lambda$ . 6.2.21; 6.2.25

$$\frac{\prod f(x|\lambda)}{g(t)} = \frac{n^{-t} t!}{\prod (x_i!)} \text{ is free of } \lambda, T \text{ is sufficient stat}$$

By definition 6.2.21,  $E[g(t)] = \sum g(t) \frac{(n\lambda)^t e^{-n\lambda}}{t!}$ .  $\forall \lambda$  iff  $g(t) = 0$ ,  $E[g(t)] = 0$ ,  $T$  is complete sufficient stat.

By property of exponential family,  $f(x|\vec{\theta}) = h(x)c(\vec{\theta})e^{\sum_{j=1}^k W_j(\vec{\theta})t_j(x)} = \frac{1}{\prod(x!)} e^{\sum x_i \ln(n\lambda) - n\lambda}$ . Then the statistic  $T(x) = \sum x_i$  is complete as long as the parameter space  $\lambda$  contains an open set in  $\mathbb{R}^k$ .

(b) Find the MVUE (Minimum Variance Unbiased Estimator) of  $\lambda$ . Lehman-Scheffé  
 $T = \sum x_i \sim \text{Pois}(n\lambda), E[T/n] = \bar{X} = \lambda$   $T/n$  is an unbiased estimator of  $\lambda$ .

$\bar{X}$  is a function of  $T$ , which is complete/sufficient,  $\bar{X}$  is MVUE of  $\lambda$ .

(c) Find the MVUE of  $\lambda^2$ :

$$E[T^2 - T] = VT + ET^2 - ET = n^2 \lambda^2, \frac{T^2 - T}{n^2} \text{ is MVUE of } \lambda^2$$

(d) Find the MVUE of  $e^{-\lambda}$ .

$$\text{Let } \delta(x_i) = \begin{cases} 1 & X_1 = 0 \\ 0 & X_1 \neq 0 \end{cases}, \sum_{i=2}^n x_i \sim \text{Pois}((n-1)\lambda) \quad E(\delta|t) = \frac{P(x_i=0)P(\sum_{i=2}^n x_i=t)}{P(\sum_{i=1}^n x_i=t)} = (\frac{n-1}{n})^t \sim \text{Bino}(t, \frac{1}{n}), x = 0$$

(e) Find the MVUE of  $P(X_i = 1) = \lambda^1 e^{-\lambda} / 1!$

$$\text{Let } \delta(x_i) = \begin{cases} 1 & X_1 = 1 \\ 0 & X_1 \neq 1 \end{cases}, E(\delta|t) = \frac{P(x_i=1)P(\sum_{i=2}^n x_i=t-1)}{P(\sum_{i=1}^n x_i=t)} = \frac{t(n-1)^{t-1}}{n^t} \sim \text{Bino}(t, \frac{1}{n}), x = 1$$

(f) Find the MVUE of  $P(X_i = k) = \lambda^k e^{-\lambda} / k!$ :

$$\text{Let } \delta(x_i) = \begin{cases} 1 & X_1 = k \\ 0 & X_1 \neq k \end{cases}, E(\delta|t) = \frac{P(x_i=k)P(\sum_{i=2}^n x_i=t-k)}{P(\sum_{i=1}^n x_i=t)} = \frac{t!}{k!(n-k)!} \frac{(n-1)^{t-k}}{n^t} \sim \text{Bino}(t, \frac{1}{n}), x = k$$

## 2016S2

### 2017FB1 6.2.1 Factorization [Bino]

Let  $Y$  be  $\text{Binomial}(n, p)$ , with  $n$  known and  $p$  unknown. Among functions  $u(Y)$  of  $Y$ ,

(a) What is the MVUE of  $p$ ?

$$f(y) = \binom{n}{y} p^y (1-p)^{n-y} = \frac{1}{y!(n-y)!} \cdot n! (1-p)^n \cdot e^{y \ln(\frac{p}{1-p})} = h(y)c(p)e^{w(p)t(y)} \text{ is Expo family. } w(p) = \ln(\frac{p}{1-p}) \text{ contains an open set. } t(y) = y \text{ is complete sufficient statistic for } p$$

$$E[\frac{Y}{n}] = np/n = p$$

(b) What is the MVUE of  $p^2$ ?

$$E[Y^2] = np + p^2(n^2 - n); E[\frac{Y^2 - Y}{n^2 - n}] = p^2$$

(c) What is the MVUE of  $pq = p(1-p)$ ?

$$E[\frac{Y}{n} - \frac{Y^2 - Y}{n^2 - n}] = E[\frac{Y(n-Y)}{n(n-1)}]$$

(d) What is the MVUE of  $P(Y = k) = \binom{n}{k} p^k (1-p)^{n-k}$ ?

$$E[\frac{Y!/(Y-k)!}{n!/(n-k)!}] = p^k; E[\frac{(n-Y)!/(n-Y-k)!}{n!/(n-k)!}] = q^k;$$

$$E[\frac{(n-Y)!/(n-Y-(n-k))!}{n!/(n-(n-k))!}] = E[\frac{(n-Y)!/(k-Y)!}{n!/(n-k)!}] = q^{n-k}$$

$$E[\frac{Y!(n-Y)!}{(Y-k)!(k-Y)!k!(n-k)!}] = \binom{n}{k} p^k (1-p)^{n-k}$$

(d) Find the asymptotic variance of your MLE in part (b), as  $n \rightarrow \infty$ . asympV

$$Var[-\frac{n}{\sum \ln x} - 1] = n^2 Var[(-\sum \ln x)^{-1}] = \frac{n^2(\theta+1)^2}{(n-1)^2(n-2)}; \lim Var[\hat{\theta}] = 0$$

$$\sqrt{n}[\tau(\hat{\theta}) - \tau(\theta)] \rightarrow n(0, \frac{[\tau'(\theta)]^2}{I(\theta)}) = n(0, (\theta+1)^2),$$

(e) Find the Cramer-Rao lower bound on the variance of an unbiased estimator of  $\theta$ . CRLB

$$Var[w] \geq (\theta+1)^2/n$$

(f) Identify the sufficient statistic for  $\theta$ . Suff

Expo family, joint pdf  $\prod f(x|\theta) = (\theta+1)^n (\prod x_i)^\theta \cdot 1, h(x)$  is free of  $\theta, T(x) = \prod x_i$  is suff (by Factorization)

(g) Suppose you've taken a sample of size  $n = 10$ . Determine the UMP test of the null hypothesis  $\theta = .5$  vs. the alternative  $\theta > 0.5$ . Karlin-Rubin

$$\Lambda = \frac{L(\theta_0)}{L(\theta_1)} \leq C \text{ has MLR, } T \text{ suff, } (\prod x_i)^{0.5-\theta_1} \leq C', 0.5 - \theta_1 < 0, -\sum \ln x_i \leq C'', P(-\sum \ln x_i \leq C'') = \alpha \text{ is UMP.}$$

$$\text{Under } H_0, -\sum \ln x_i \sim Gamma(10, \frac{1}{0.5+1}), -3 \sum \ln x_i \sim Gamma(10, 2) = \chi_{20}^2, P(-3 \sum \ln x_i \geq C''') = 1 - \alpha = 0.95, C''' = \chi_{20,0.95}^2 = 10.851, P(-3 \sum \ln x_i \leq 10.851) = 0.05$$

## 2016F8

2007F3A 2008S2A 2009FA2 2018FA1 2019SA1

Let  $(Y_1, Y_2)$  have the joint pdf  $f(y_1, y_2) = \begin{cases} c(1-y_2) & 0 \leq y_1 \leq y_2 \leq 1 \\ 0 & \text{o.w.} \end{cases}$

(a) Find the value of  $c$ .  $c = 6$

$$\int_0^1 \int_0^{y_2} c(1-y_2) dy_1 dy_2 = 1$$

(b) Find the marginal density functions of  $Y_1$  and  $Y_2$ .

$$f_{Y_1}(y_1) = \int_{y_1}^1 dy_2 = 3(y_1 - 1)^2$$

$$f_{Y_2}(y_2) = \int_0^{y_2} dy_1 = 6(y_2 - y_2^2)$$

(c) Find  $P(Y_1 \leq \frac{1}{2} | Y_2 \leq \frac{3}{4}) = 25/27$

$$P(Y_1 \leq \frac{1}{2}, Y_2 \leq \frac{3}{4}) = P(Y_1 \leq \frac{1}{2}, Y_2 \leq \frac{1}{2}) + P(Y_1 \leq \frac{1}{2}, \frac{1}{2} \leq Y_2 \leq \frac{3}{4})$$

$$= \int_0^{\frac{1}{2}} \int_0^{y_2} f(y_1, y_2) dy_1 dy_2 + \int_{\frac{1}{2}}^{\frac{3}{4}} \int_0^{\frac{1}{2}} f(y_1, y_2) dy_1 dy_2 = 25/32$$

$$P(Y_2 \leq 3/4) = \int_0^{\frac{3}{4}} f_{Y_2}(y_2) dy_2 = 27/32$$

## 2017S

Ian Dinwoodie, Robert Fountain

### 2017S1

3.E.20  
Let  $\Theta$  be a real-valued random variable with density  $f_{\Theta}(\theta) = \frac{1}{\sqrt{2\pi}} e^{-\theta^2/2}, \theta \in \mathbb{R}$ , and let  $Y$  have conditional density  $f(y|\theta) = \frac{1}{\sqrt{2\pi}} e^{-(y-\theta)^2/2}, y \in \mathbb{R}$ . Determine  
(a) the conditional density of  $\Theta$  given  $Y = y$ , (2 pts)  
 $f(y, \theta) = f(y|\theta)f(\theta) = f(y)f(\theta|y), u \sim$   
 $f(\theta|Y = y) \sim N(\frac{y}{2}, \frac{1}{2})$   
(b) the marginal density of  $Y$ . (3 pts)  
 $f(y) = \frac{1}{2\pi} e^{-y^2/4} \sim N(0, 2)$

### 2017S2

Example 4.3.6 Distribution of the ratio of normal variables [4.E.28]  
If  $Z_1, Z_2$  are independent standard normal random variables, find the density of  $Z_1/Z_2 \sim \text{Cauchy}(0, 1)$ .  
 $J = v, f(u, v) = f(z_1)f(z_2)|J|$   
 $f(u) = \int_{-\infty}^{\infty} \frac{|v|}{2\pi} e^{-\frac{u^2+1}{2}v^2} dv = \frac{1}{\pi(u^2+1)} \int_0^{\infty} (u^2+1)v e^{-\frac{u^2+1}{2}v^2} dv =$   
 $\frac{1}{\pi(u^2+1)} \int_0^{\infty} e^{-\frac{u^2+1}{2}v^2} d[(u^2+1)v^2]$

### 2017S3

[Expo] [5.2.7 mgf of the sample mean]  
Suppose  $X_1, X_2, \dots, X_n$  is a random sample of  $\text{Exp}(1)$  random variables. Find the moment generating function  $M(t) = E(e^{tX(1)}), t \in \mathbb{R}$ , where  $X_{(1)}$  is the minimum. (5 pts)  
 $f_{X_1}(x) = ne^{-x}[1 - (1 - e^{-x})]^{n-1} = ne^{-nx} \sim \text{Expo}(\lambda = n, \beta = \frac{1}{n})$   
MGF =  $\frac{1}{1-\beta t} = \frac{1}{1-t/n}$   
Or  $E[e^{tX_{(1)}}] = \int_0^{\infty} e^{tx} ne^{-nx} dx = \frac{n}{n-t} \int_0^{\infty} (n-t)e^{-(n-t)x} dx$

### 2017S4

[Example 5.2.8 Distribution of the mean]  
Let  $X = e^Z$  be a lognormal random variable,  $Z \sim N(0, 1)$ . Find its skewness  $E(X - \mu)^3 / \sigma^3$ .  
 $M_Z(t) = e^{\frac{1}{2}t^2}; E[X^n] = E[(e^Z)^n] = M_Z(n) = e^{\frac{1}{2}n^2},$   
 $E[X^n] = e^{n\mu + n^2\sigma^2/2} E[X^1] = e^{1/2}; E[X^2] = e^2; E[X^3] = e^{9/2}$   
 $E \frac{X - \mu^3}{\sigma^3} = \frac{x^3 - 3x^2\mu + 3x\mu^2 + \mu^3}{(EX^2 - E^2X)^{3/2}} = \frac{e^{9/2} - 3e^{5/2} + 2e^{3/2}}{(e^2 - e)^{3/2}} = (e + 2)\sqrt{e - 1}$

### 2017S5

MLE Cor  
Suppose  $X_1, X_2, \dots, X_n$  is a random sample of  $N(\mu, \sigma^2)$  random variables.  
(a) Find the expectation of the MLE for  $\sigma^2$ . (3 pts)  
 $\mu$  known,  $\hat{\sigma}^2 = \frac{\sum (x_i - \mu)^2}{n}, E[\hat{\sigma}^2] = \frac{\sum E[(x_i - \mu)^2]}{n} = \sigma^2; \mu$  unknown  
 $\hat{\sigma}^2 = \frac{\sum (x_i - \bar{x})^2}{n}, E[\hat{\sigma}^2] = \frac{E[\sum (x_i - \bar{x})^2]}{n} = \frac{(n-1)E[S^2]}{n} = \frac{(n-1)\sigma^2}{n}$   
(b) Compute the correlation of  $\bar{X}$  and  $X_n$ . (2 pts)  
 $\text{Var}[X_n] = \sigma^2, \text{Var}[\bar{X}] = \sum \text{Var}[X_i] / n^2 = \sigma^2 / n$   
 $\text{Cov}[\bar{X}, X_n] = \text{Cov}[\sum X_i, X_n] / n = \frac{\sigma^2}{n}$   
 $\rho = \frac{\text{Cov}[\bar{X}, X_n]}{\sqrt{\text{Var}[\bar{X}] \text{Var}[X_n]}} = \frac{1}{\sqrt{n}}$   
Another methods may not work  $(1 - \rho^2)\sigma^2 = \frac{\sigma^2}{n}$

### 2017S6

2003F9 2011F6 UMP  
Let  $X_1, X_2, X_3, \dots$  be i.i.d.  $\text{Poisson}(\lambda)$  random variables. Find a UMP (uniformly most powerful) test of  $H_0: \lambda \leq 1$  versus  $H_1: \lambda > 1$  at a level  $\alpha$  near .05. (5 pts)  
 $\lambda_0 < \lambda_1$ , by Neyman-Pearson, Reject  $H_0$  if  
 $\Lambda = \frac{L(\lambda_0)}{L(\lambda_1)} = (\frac{\lambda_0}{\lambda_1})^{\sum x_i} e^{n(\lambda_1 - \lambda_0)} < C$   
Expo family  $T = \sum x_i$  is Suffi;  $\Lambda$  has  $\searrow$  MLR in  $T$ , is a monotone decreasing function of  $T$ ,  
then  $T > C$  is UMP test at  $\alpha = P_{\theta_0}(T > C) = 0.05$   
Under  $H_0$ , set  $\lambda = 1$  to max  $\Lambda, T = \sum x_i \sim \text{Pois}(n)$ . When  $C = 4$ ,  $P_{\theta_0}(T > 4) < 0.05$

### 2017S7

2019SA3 [Beta-Bino] 2019.2.28 Example 4.4.6  
Suppose that  $(P, X)$  is a pair of random variables with  $P \sim \text{Beta}(\frac{1}{2}, \frac{1}{2})$  and then  $X|_{P=p} \sim \text{bin}(n, p)$ . Find the variance of  $X$ .  
 $E[X] = \frac{n\alpha}{\alpha+\beta} = \frac{n}{2}; V[X] = \frac{n\alpha\beta(\alpha+\beta+n)}{(\alpha+\beta)^2(\alpha+\beta+1)} = \frac{n(n+1)}{8}$   
 $E[P] = \frac{1}{2}, E[P^2] = \frac{3}{8}, \text{Var}[P] = \frac{1}{8}$   
 $E[\text{Var}(X|P)] + \text{Var}[E(X|P)] = E[np(1-p)] + \text{Var}[np] = \frac{n}{2} - \frac{3n}{8} + \frac{n^2}{8}$

### 2017S8

CRLB  
Let  $X_1, X_2, \dots, X_n$  be a random sample of  $N(\mu, \sigma^2)$  random variables. Find the Cramer-Rao lower bound on the variance of an unbiased estimator for  $\sigma^2$ . (Assume  $\mu$  is known.)  
 $I_{\sigma^2} = \frac{1}{2\sigma^4}; \text{Var}[\hat{\sigma}_U^2] \geq \frac{2\sigma^4}{n}$

2017FA4

2016F4 2018FB4 median

Let  $F$  be the cdf of an exponential random variable with median 10 and let  $G$  be that of an independent exponential random variable  $Y$  with median 5. Find the distribution of  $V = F(X) + G(Y)$ .

$$\frac{1}{2} = \int_0^{10} \lambda_x e^{-\lambda_x x} dx = \int_0^5 \lambda_y e^{-\lambda_y y} dy$$

$$\text{median} = \frac{\ln 2}{\lambda}, \lambda_x = \frac{\ln 2}{10}, \lambda_y = \frac{\ln 2}{5}$$

$$F(x) = 1 - e^{-\frac{\ln 2}{10}x}, G(y) = 1 - e^{-\frac{\ln 2}{5}y}$$

$$\text{Let } U = G(y), y = -\frac{1}{\lambda} \ln(1-u), \frac{dy}{du} = \frac{1}{\lambda(1-u)}; g_Y(y) = \lambda e^{-\lambda y}$$

$$g_U(u) = g_Y(y) \left| \frac{dy}{du} \right| = \lambda e^{-\lambda y} \frac{1}{\lambda(1-u)} = \frac{1}{1-u} e^{-\lambda [-\frac{1}{\lambda} \ln(1-u)]} = 1$$

$$\text{c.d.f } F, G \sim \text{Unif}(0,1), u = g_Y(y) = f + g, f = v - u, 0 < v - u < 1, v - 1 < u < v$$

$$g(u, v) = f(f, g) |J| = 1, g(v) = \int_0^v 1 du = v, 0 \leq v \leq 1, g(v) = \int_{v-1}^1 1 du = 2 - v, 1 \leq v \leq 2$$

2017FB1

2016S2 Example 6.2.22

Let  $Y$  be  $\text{Binomial}(n, p)$ , with  $n$  known and  $p$  unknown. Among functions  $u(Y)$  of  $Y$ ,

(a) What is the MVUE of  $p$ ?

(b) What is the MVUE of  $p^2$ ?

(c) What is the MVUE of  $pq = p(1-p)$ ?

(d) What is the MVUE of  $P(Y = k) = \binom{n}{k} p^k (1-p)^{n-k}$ ?

2017FB2

2007F2B 2014F5B power

Let  $X_1, X_2, \dots, X_{10}$  be a random sample from an exponential distribution with location parameter  $\theta$  with pdf  $f(x; \theta) = \begin{cases} e^{-(x-\theta)} & \theta < x < \infty \\ 0 & \text{e.w.} \end{cases}$  where  $-\infty < \theta < \infty$  is an unknown parameter. For testing the null hypothesis  $H_0 : \theta = 0$  vs the alternative  $H_1 : \theta > 0$ , a reasonable test is to reject the null hypothesis if  $X_{(1)} = \min\{X_1, X_2, \dots, X_{10}\} \geq C$ . Find  $C$  so that the size of the test is 0.05. Also find the power of this test at  $\theta = 1$ . Is this test unbiased?

Let  $Y = X - \theta, X = Y + \theta, \frac{dy}{dx} = 1, f_Y(y) = f_X(x) |1| = e^{-y} \sim \text{Expo}(1)$ ;

$$Y_{(1)} = ne^{-ny} \sim \text{Expo}(10), \text{Gamma}(1, \frac{1}{10}); 20Y_{(1)} \sim \chi_2^2$$

$$P_{H_0}(X_{(1)} \geq C) = P_{H_0}(Y_{(1)} + 0 \geq C) = P_{H_0}(20Y_{(1)} \geq 20C) \stackrel{\text{set}}{=} 0.05, 20C = 5.991, C = 0.29955$$

$$\beta = P_{H_1}(X_{(1)} \geq 0.29955) = P_{H_1}(Y_{(1)} + 1 \geq 0.29955) = P_{H_1}(Y_{(1)} \geq -0.70045) = 1, \text{the power function minimized at the null value means unbiasedness.}$$

2017FB3

2008S5B HypoT

Let  $X_1, X_2, \dots, X_m$  be a random sample of size  $m$  from  $N(\theta, 1)$  distribution and let  $Y_1, \dots, Y_m$  be an independent random sample of size  $m$  from  $N(3\theta, 1)$ .

(a) Show that the joint distribution of  $X$ 's and  $Y$ 's has MLR (monotone likelihood ratio) property. MLR

Let  $\theta_0 < \theta_1$ ,

$$\Lambda = \frac{L(\theta_0)}{L(\theta_1)} = e^{(\theta_0 - \theta_1)(\sum x + 3\sum y) - 10m(\theta_0^2 - \theta_1^2)} < C$$

It is a monotone  $\searrow$  function of  $\sum x + 3\sum y$ , then  $f(x, y)$  has MLR.

(b) Find the UMP test of size  $\alpha$  for testing  $H_0 : \theta \leq 0$  vs  $H_1 : \theta > 0$ .

$$\bar{X} \sim n(\theta, \frac{1}{m}), 3\bar{Y} \sim n(3\theta, \frac{9}{m}), \bar{X} + 3\bar{Y} \sim n(10\theta, \frac{10}{m})$$

$$\text{By C.L.T, under } H_0, \sqrt{\frac{m}{10}}(\bar{X} + 3\bar{Y} - 10\theta) \xrightarrow{D} n(0, 1)$$

$$P_{\theta_0}(\sqrt{\frac{m}{10}}(\bar{X} + 3\bar{Y} - 10\theta_0) > Z_\alpha) = \alpha \text{ is the UMP test of size } \alpha$$

(c) Find an expression of the power function of the UMP test.

$$\beta = P_{\theta_1}(\sqrt{\frac{m}{10}}(\bar{X} + 3\bar{Y} - 10\theta_1) > Z_\alpha - (\theta_1 - \theta_0)\sqrt{10m})$$

$$= P_{\theta_1}(Z > Z_\alpha - \delta\sqrt{10m} \text{ where } \delta = \theta_1 - \theta_0)$$

- Find the marginal density functions of  $Y_1$  and  $Y_2$  and check whether they are independent.  
 $f_{Y_1} = 2 - 2y_1; f_{Y_2} = 2y_2$  dependent
- Find  $E[Y_1 + Y_2], E[Y_1] + E[Y_2] = \int_0^1 y_1(2 - 2y_1)dy_1 + \int_0^1 y_2(2y_2)dy_2 = \frac{1}{3} + \frac{1}{2} = 1$
- Find  $P(Y_1 \leq 3/4 | Y_1 > 1/3) = \frac{\int_{1/3}^{3/4} f_{Y_1}(y) dy}{1 - \int_0^{1/3} f_{Y_1}(y) dy} = \frac{55}{64}$

### 2018FA2

[Expo] [Example 5.4.5 Range][5.4]  
Let  $X_1, X_2, \dots, X_n$  be a random sample from an exponential distribution with mean 5.  
the memoryless property of the exponential distribution, the difference between  $Y_{(n)}$  and  $Y_{(1)}$  is independent of the actual value of  $Y_{(1)}$ . So to find the distribution of  $R = Y_{(n)} - Y_{(1)}$  we can operate under the assumption that  $Y_{(1)} = 0$ .

Then  $P(R < r)$  is the probability that the remaining  $n - 1$  sample observations all fall in the range  $(0, r)$ . This is because (under the assumption that the smallest observation is 0),  $R < r$  means that the largest observation must be smaller than r. In order for that to happen, all  $n - 1$  of the remaining sample observations must be smaller than r.  
(a) Find the CDF of the sample range

$$Y_{(n)} = ne^{-Y_{(n)}}(1 - e^{Y_{(n)}})^{n-1}$$

$P(n-1 \text{ independent sample observations are all smaller than } r) P(R < r) = \left(\int_0^r e^{-x} dx\right)^{n-1} = (1 - e^{-r})^{n-1}$

$$f_R(r) = (n-1)(1 - e^{-r})^{n-2} e^{-r}$$

(b) Find the expected value of the sample range

$$X_{(n)} = ne^{-Y_{(n)}}(1 - e^{Y_{(n)}})^{n-1}$$

$$E[R_n] = \frac{1}{\lambda} \sum_{k=1}^{n-1} \frac{1}{k}; V[R_n] = \frac{1}{\lambda^2} \sum_{k=1}^{n-1} \frac{1}{k^2}$$

$k^{th}$  moment of range

### 2018FA3

(a) (5 pts) In the daily production of a certain type of rope, the number of defects per foot,  $X$  is assumed to have a Poisson distribution with mean  $\lambda = 3$ . The profit per foot of the rope sold is given by  $P = 30 - 3X - X^2$  Find the expected profit per foot.

$$E[P] = 30 - 3EX - EX^2 = 9$$

(b) (5 pts) Suppose that  $X$  is distributed as  $U(0, 1)$  and that  $Y$  is a random variable with  $E(Y|X = x) = \alpha + \beta x^2$  Find  $E[Y]$ .  
p164-7(190-3)

$$E[Y] = E(E[Y|X]) = \alpha + \beta EX^2 = \alpha + \beta/3$$

$$\sigma^2 = \frac{1}{\mu} = \mu,$$

By CLT  $\sqrt{n}(\bar{X}_n - \mu) \xrightarrow{D} N(0, \mu)$ ,

let  $g(\bar{X}_n) = e^{-\bar{X}_n}, g(\mu) = e^{-\mu}, g'(\mu) = -e^{-\mu} \neq 0$

$$\sqrt{n}(e^{-\bar{X}_n} - e^{-\mu}) \rightarrow n(0, \frac{[(e^{-\mu})']^2}{I(\mu)}) = n(0, \mu e^{-2\mu}))$$

### 2018FB1

LRT asymD [8.2.2] [8.2.6]  
(4+6 pts) Let  $X_1, X_2, \dots, X_n$  be a random sample from a normal distribution with mean 120 and unknown variance  $\sigma^2$ . Derive the likelihood ratio test for testing the null hypothesis  $H_0 : \sigma^2 = 4$  against the alternative  $H_1 : \sigma^2 \neq 4$ . Also find the exact as well as the asymptotic null distributions of your test statistic.

### 2018FB2

2003S7 2008F5 2009SB1 2009FB4 2016S4 **2016F7** 2017FB4 2019SB4  
Let  $X_1, X_2, \dots, X_n$  be a random sample of size n from a probability density function  $f(x; \theta) = \begin{cases} (\theta + 1)x^\theta & 0 < x < 1 \\ 0 & o.w. \end{cases}$  where  $\theta > -1$  is an unknown parameter.

- Find  $\hat{\theta}$ , the maximum likelihood estimator of  $\theta$ .
- What is the asymptotic distribution of  $\hat{\theta}$ ?
- Using  $\hat{\theta}$ , create an unbiased estimator  $\hat{\theta}_U$  of  $\theta$ .
- Find the Cramer-Rao lower bound for an unbiased estimator of  $\theta$ .

### 2018FB3

perc Normal MSE Normal variance bound  
Let  $X_1, X_2, \dots, X_n$  be a random sample from  $N(\mu, \sigma^2)$  distribution. Find a lower bound on the variance of any unbiased estimator of the 95th percentile of this distribution based on the Information Inequality. Also compare this bound to the variance of the uniformly minimum variance unbiased estimator.  
 $\bar{X}$  and  $S^2$  are unbiased estimator of  $\mu$  and  $\sigma^2$ .  
 $\bar{X}$  and  $S^2$  are complete sufficient statistic for  $\mu$  and  $\sigma^2$ .

$$I_\mu = \frac{1}{\sigma^2}, V[\hat{\mu}] \geq \frac{1}{n/\sigma^2} = \frac{\sigma^2}{n};$$

$$I_{\sigma^2} = \frac{1}{2\sigma^4}, V[\hat{\sigma}^2] \geq \frac{1}{n/2\sigma^4} = \frac{2\sigma^4}{n};$$

$$\frac{X_{(95)} - \mu}{\sigma} = Z_{(95)} = 1.645;$$

$$X_{(95)} = \mu + 1.645\sigma;$$

$$\frac{d}{d\mu} X_{(95)} = 1; V[\hat{\mu}_{(95)}] \geq \frac{1}{n/\sigma^2} = \frac{\sigma^2}{n}$$

$$\frac{d}{d\sigma} X_{(95)} = 1.645; V[\hat{\sigma}_{(95)}^2] \geq \frac{1.645^2}{n/2\sigma^4} = \frac{1.645^2 \cdot 2\sigma^4}{n} > \frac{2\sigma^4}{n}$$

The result shows that  $\hat{\mu}_{(95)}$  is UMVUE but  $\hat{\sigma}_{(95)}^2$  cannot attain the CRLB. there is no UMVUE of  $\sigma^2$ .  $S^2$  is unbiased but not minimized. MLE  $\sigma^2$  is minimized but biased. CRLB is between two of them. they are ARE.

Standard Power distribution

## 3.4 Exponential Families

$f(x|\theta) = h(x)c(\theta)e^{\sum_{i=1}^k W(\theta_i)t_i(x)}$

the continuous families: normal, gamma, and beta; the discrete families-binomial, Poisson, and negative binomial.

## 3.5 Location and Scale Families

## 3.6 Inequalities and Identities

### 3.6.1

Probability Inequalities {#Cheb}

**Theorem 3.6.1 (Chebychev's Inequality)**  $P(g(X) \geq r) \leq \frac{Eg(X)}{r}$ ,  $X$  be a r.v.  $g(x)$  be a nonnegative fn.  $\forall r > 0$

**Example 3.6.2 (Illustrating Chebychev)**  $P(|x - \mu| < t\sigma) \geq 1 - \frac{1}{t^2}$

### 3.6.2 Identities

**Lemma 3.6.5 (Stein's Lemma)** Let  $X \sim n(\theta, \sigma^2)$ , and let  $g$  be a differentiable function satisfying  $E[g'(X)] < \infty$ . Then  $E[g(X)(X - \theta)] = \sigma^2 E[g'(X)]$

## 3.E

$E(Z^{2k}) = \frac{(2k)!}{2^k k!}, k = 1, 2, \dots$

$E(Z^{2k+1}) = 0$

### 3.E.17

$E[X^k] = \frac{\beta^k \Gamma(k+\alpha)}{\Gamma(\alpha)}$  [561-HW5]

### 3.E.20

folded normal

### 3.E.23

Pareto distribution

LRT for  $\alpha = 1$  vs  $\neq 1$  ( $\beta$  unknown):  $\ln \lambda = n \ln(1 - T)$ , where  $T = n \ln x_{(1)} / \sum \ln(x_i)$  reject small  $\lambda$  = reject large  $T$ .

let  $Y = \ln x, Y \sim \text{Exp}(\beta)$  under  $H_0$ .  $Y_{(1)} = \text{Expo}(n\beta), nY_{(1)} = \text{Exp}(\beta), \sum Y_i = \sum (n - i - 1)(Y_{(i)} - Y_{(i-1)}) = nY_{(1)} + \sum_2 D_i$  Where  $D_i \sim \text{iid Exp}(\beta), \sum_2 D_i \sim \text{Gamma}(n - 1, \beta), T \sim \text{Beta}(1, n - 1)$ .

## 4. Multiple Random Variables

### 4.1 Joint and Marginal Distributions {#marg}

4.1.3 marginal probability density functions

$$4.1.6 f_X(x) = \sum_{y \in \mathbb{R}} f_{X,Y}(x,y) = \int_{-\infty}^{\infty} f(x,y) dy$$

$$4.1.10 \text{ joint pdf } E[g(X,Y)] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} g(x,y) f(x,y) dx dy$$

### 4.2 Conditional Distributions and Independence {#cond}

$$4.2.1 f(x|y) = P(X = x|Y = y) = \frac{f(x,y)}{f_Y(y)}$$

$$4.2.3 E[g(X)|y] = \sum_x g(x) f(x|y) = \int_{-\infty}^{\infty} g(x) f(x|y) dx$$

$$E[g(X)h(Y)|y] = h(Y)E[g(X)|y] \quad E[XY] = E[X]E[Y] = E[g(X)]E[h(Y)]$$

$$4.2.4 \text{ Calculating conditional pdfs } V[X|Y] = E[(X - E[X|Y])^2|Y] = \sum_x [x - E[X|Y]]^2 f(x|y) = E[X^2|y] - (E[X|y])^2 \sigma_{aX+b} = |a| \sigma_x$$

$$4.2.5 \text{ independent } f(x,y) = f_X(x)f_Y(y)$$

$$4.2.7 \perp f(x,y) = g(x)h(y)$$

$$U \sim \text{Geom}(\frac{1}{2}), u = 1, 2, \dots V \sim \text{NBin}(2, \frac{1}{2}), v = 2, 3, \dots \{(u,v) : u = 1, 2, \dots; v = u + 1, u + 2, \dots\} U \not\perp V$$

$$4.2.10 P(X \leq x, Y \leq y) = P(X \leq x)P(Y \leq y)$$

$$4.2.12 M_Z(t) = M_X(t)M_Y(t)$$

$$4.2.14 X \sim n(\mu, \sigma^2), \perp Y \sim n(\gamma, \tau^2) \quad X + Y \sim n(\mu + \gamma, \sigma^2 + \tau^2)$$

$$4.3.5 X \perp Y, g(X) \perp h(Y)$$

$$F(x,y) = P(X \leq x, Y \leq y) = \int_{-\infty}^y \int_{-\infty}^x f(s,t) ds dt \quad F_{X,Y}(x,y) = F_X(x)F_Y(y)$$

### 4.3 Bivariate Transformations {#trans} {#indep-2}

**Example 4.3.1 (Distribution of the sum of Poisson variables)**

**Theorem 4.3.2** if  $X \sim \text{Poisson}(\theta)$  and  $Y \sim \text{Poisson}(\lambda)$  and  $X$  and  $Y$  are independent, then  $X + Y \sim \text{Poisson}(\theta + \lambda)$ .

$$M_W(t) = M_X(t)M_Y(t) = e^{\mu_1(e^t - 1)}e^{\mu_2(e^t - 1)} = e^{(\mu_1 + \mu_2)(e^t - 1)}$$

$$f_{U,V}(u,v) = f_{X,Y}(h_1(u,v), h_2(u,v)) |J|$$

$$u = g_1(x,y), x = h_1(u,v), v = g_2(x,y), y = h_2(u,v) \quad J = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} =$$

$$\frac{\partial x}{\partial u} \frac{\partial y}{\partial v} - \frac{\partial y}{\partial u} \frac{\partial x}{\partial v}$$

**Example 4.3.3 (Distribution of the product of beta variables)** Let  $X \sim \text{Beta}(\alpha, \beta)$  and  $Y \sim \text{Beta}(\alpha + \beta, \gamma)$  be independent random variables. The joint pdf of  $(X,Y) \sim n(\alpha, \beta + \gamma)$

$$X \sim \text{Beta}(\alpha, \beta), Y \sim \text{Beta}(\alpha + \beta, \gamma) \quad X \perp Y, U = XY, f_U(u) \sim n(\alpha, \beta + \gamma)$$

**Example 4.3.4 (Sum and difference of normal variables):**

$$X \sim n(0, 1), Y \sim n(0, 1), X \perp Y, X - Y \sim n(0, 2), X + Y \sim n(0, 2)$$

**Theorem 4.3.5** Let  $X$  and  $Y$  be independent random variables. Let  $g(x)$  be a function only of  $x$ ; and  $h(y)$  be a function only of  $y$ . Then the random variables  $U = g(X) \perp V = h(Y)$ .

$$= \sum_{i=1}^k f_{X,Y}(h_{1i}(u,v), h_{2i}(u,v)) |J_i|$$

**Example 4.3.6 (Distribution of the ratio of normal variables)**  $X \perp Y, U = \frac{X}{Y} \sim \text{Cauchy}(0, \mu) \quad V = |Y|$

## 4.4

Hierarchical Models and Mixture Distributions

Example 4.4.1 (Binomial-Poisson hierarchy)

Example 4.4.2 (Continuation of Example 4.4.1)

**Theorem 4.4.3 Law of iterated Expectation** if  $X$  and  $Y$  are any two random variables, then  $E[X] = \int_{-\infty}^{\infty} x f(x) dx = E[E(X|Y)]$

$$E[g(x)] = \sum_{x \in D} h(x) p(x) = \int_{-\infty}^{\infty} g(x) f(x) dx$$

$$E[(X - \mu)^n] = \mu_n = \sum (x - \mu)^n p(x) = \int (x - \mu)^n f(x) dx$$

$$E(aX + b) = aE(X) + b$$

$$E[g(\vec{X})] = \sum \cdots \sum_{\text{all } \vec{x}} g(\vec{x}) p(\vec{x}) = \int \cdots \int_{\mathbb{R}^n} g(\vec{x}) f(\vec{x}) d\vec{x}$$

**Definition 4.4.4 mixture distribution**

**Example 4.4.5 (Generalization of Example 4.4.1)**

$$X|Y \sim \text{Bin}(Y, p), Y|\Lambda \sim \text{Pois}(\Lambda), \Lambda \sim \text{Expo}(\beta)$$

$$X|Y \sim \text{Bin}(Y, p), Y \sim \text{NBin}(1, \frac{1}{1+\beta})$$

$$\text{Pois-Gamma } Y|\Lambda \sim \text{Pois}(\Lambda), \Lambda \sim \text{Gamma}(\alpha, \beta), Y \sim \text{NBin}(\alpha, \frac{1}{1+\beta})$$

**Example 4.4.6 (Beta-binomial hierarchy)** 2019.2.28 {#Beta-Bino}

$$X|P \sim \text{Bin}(n, P), P \sim \text{Beta}(\alpha, \beta), EX = E[E(X|P)] = E[nP] = n \frac{\alpha}{\alpha + \beta}$$

$$N_1|\theta \sim \text{Bin}(n, \theta), \theta \sim \text{Beta}(1, 1), N_1 \sim \text{Unif}(0, n + 1), \theta|N_1 \sim \text{Beta}(n_1 + 1, n - n_1 + 1)$$

**Theorem 4.4.7 (Conditional variance identity)** For any two random variables  $X$  and  $Y$ ,  $V[X] = \sigma_X^2 = E(X^2) - [E(X)]^2 = E[V(X|Y)] + V[E(X|Y)] \quad V[aX + b] = a^2 \sigma^2$

$$\text{Example 4.4.8 (Continuation of Example 4.4.6) Beta-Bin } V[X] = V[E(X|P)] + E[V(X|P)] = \frac{n^2 \alpha \beta}{(\alpha + \beta)^2 (\alpha + \beta + 1)} + \frac{n \alpha \beta}{(\alpha + \beta)(\alpha + \beta + 1)} = \frac{n \alpha \beta (\alpha + \beta + n)}{(\alpha + \beta)^2 (\alpha + \beta + 1)}$$

### 4.5 Covariance and Correlation {#Cov} {#Cor}

**Definition 4.5.1** The covariance of  $X$  and  $Y$  is the number defined by  $\text{Cov}(X, Y) = E[(X - \mu_X)(Y - \mu_Y)] = \sigma_{XY}$

**Definition 4.5.2** The correlation of  $X$  and  $Y$  is the number defined by  $\rho_{XY} = \frac{\sigma_{XY}}{\sigma_X \sigma_Y} \quad \text{Cor}(X, Y) = \frac{\text{Cov}(X, Y)}{\sqrt{\text{Var}(X)\text{Var}(Y)}}$

**Theorem 4.5.3** For any two random variables  $X$  and  $Y$ ,  $\sigma_{XY} = \text{Cov}(X, Y) = E[XY] - \mu_X \mu_Y$

Properties of  $\text{Cov}(x, y)$

$$\text{Cov}(aX, bY) = ab \text{Cov}(X, Y) \quad (1) \text{Cov}(X, Y + Z) = \text{Cov}(X, Y) + \text{Cov}(X, Z) \quad (2) \text{Cov}(X, c) = 0 \quad (3) X \perp Y, \text{Cov}(X + Y, X - Y) = \text{Cov}(X, X) - \text{Cov}(Y, Y) = V[X] - V[Y]$$

$$\text{Cov}(X, X) = E[X^2] - \mu_X^2$$

**Example 4.5.4 (Correlation-I)**

**Theorem 4.5.5** If  $X$  and  $Y$  are independent (uncorrelated) random variables, then  $\text{Cov}(X, Y) = 0$  and  $\rho_{XY} = 0$

Always check if  $X$  and  $Y$  are independent. When  $y = x^2$ ,  $X$  and  $Y$  are dependent, but  $\text{Cov}(X, Y) = 0$

**Theorem 4.5.6** If  $X$  and  $Y$  are any two random variables and  $a$  and  $b$  are any two constants, then  $V[aX \pm bY] = a^2 V[X] + b^2 V[Y] \pm 2ab \text{Cov}(X, Y)$  If  $X$  and  $Y$  are independent random variables, then  $\text{Var}(aX + bY) = a^2 \text{Var}X + b^2 \text{Var}Y$

**Theorem 4.5.7** For any random variables  $X$  and  $Y$ ,

$$a. -1 \leq \rho_{XY} \leq 1.$$

$$b. |\rho_{XY}| = 1 \text{ if and only if there exist numbers } a \neq 0 \text{ and } b \text{ such that } P(Y = aX + b) = 1. \text{ If } \rho_{XY} = 1, \text{ then } a > 0, \text{ and if } \rho_{XY} = -1, \text{ then } a < 0.$$

**Example 4.5.8 (Correlation-II)**

**Example 4.5.9 (Correlation-III)**

$$\text{Definition 4.5.10 bivariate normal pdf with } \mu_X, \mu_Y, \sigma_X^2, \sigma_Y^2, \rho$$
$$f(x,y) = \frac{1}{2\pi\sigma_X\sigma_Y\sqrt{1-\rho^2}} \exp\left(-\frac{1}{2(1-\rho^2)}\left[\left(\frac{x-\mu_X}{\sigma_X}\right)^2 - 2\rho\left(\frac{x-\mu_X}{\sigma_X}\right)\left(\frac{y-\mu_Y}{\sigma_Y}\right) + \left(\frac{y-\mu_Y}{\sigma_Y}\right)^2\right]\right)$$

$$f_X(x) \sim n(\mu_X, \sigma_X^2) \quad f_Y(y) \sim n(\mu_Y, \sigma_Y^2)$$

$$f_{Y|X}(y|x) \sim n(\mu_Y + \rho \frac{\sigma_Y}{\sigma_X}(x - \mu_X), \sigma_Y^2(1 - \rho^2))$$

$$aX + bY \sim n(a\mu_X + b\mu_Y, a^2\mu_X^2 + b^2\mu_Y^2 + 2ab\rho\sigma_X\sigma_Y)$$

### 4.6 Multivariate Distributions

Example 4.6.1 (Multivariate pdfs)

**Definition 4.6.2** multinomial distribution with  $m$  trials and cell probabilities

Example 4.6.3 (Multivariate pmf)

**Theorem 4.6.4 (Multinomial Theorem)**

**Definition 4.6.5** mutually independent random vectors

$$\text{Theorem 4.6.6 (Generalization of Theorem 4.2.10)} \quad E[g_1(X_1) \cdots g_n(X_n)] = E[g_1(X_1)] \cdots E[g_n(X_n)] \quad X_1, \dots, X_n$$

$$E[g(X)|y] = E[g(X)]$$

**Theorem 4.6.7 (Generalization of Theorem 4.2.12)**  $M_Z(t) = (M_X(t))^n$

**Example 4.6.8 (Mgf of a sum of gamma variables)**  $X_1, \dots, X_n \sim \text{Gamma}(\alpha, \beta)$ ,  $X_1 + \dots + X_n \sim \text{Gamma}(\alpha_1 + \dots + \alpha_n, \beta)$   
 $\bar{X} \sim \text{Gamma}(\sum \alpha, \beta/n)$  indep

**Corollary 4.6.9**

**Corollary 4.6.10**

**Theorem 4.6.11 (Generalization of Lemma 4.2.1)**

**Theorem 4.6.12 (Generalization of Theorem 4.3.5)** Let  $X_1, \dots, X_n$  be independent random vectors. Let  $g_i(X_i)$  be a function only of  $X_i, i = 1, \dots, n$ . Then the random variables  $U_i = g_i(X_i), i = 1, \dots, n$ , are **mutually independent**.

**Example 4.6.13 (Multivariate change of variables)**

## 4.7 Inequalities

### 4.7.1

Numerical Inequalities {#Jensen}

**Theorem 4.7.3 (Cauchy-Schwarz Inequality)** For any two random variables  $X$  and  $Y$ ,  $|EXY| \leq E|XY| \leq (E|X|^2)^{\frac{1}{2}}(E|Y|^2)^{\frac{1}{2}}$

**Example 4.7.4 (Covariance inequality)**

$$|E(X - \mu_X)(Y - \mu_Y)| \leq (E|X - \mu_X|^2)^{\frac{1}{2}}(E|Y - \mu_Y|^2)^{\frac{1}{2}}$$

$$\text{Cov}(X, Y) \leq \sigma_X^2 \sigma_Y^2$$

**Theorem 4.7.5 (Minkowski's Inequality)**

### 4.7.2 Functional Inequalities

**Definition 4.7.6** convex

**Theorem 4.7.7 (Jensen's Inequality)**

Convex function  $Eg(X) \geq g(EX)$

**Example 4.7.8 (An inequality for means)** Jensen's Inequality can be used to prove an inequality between three different kinds of means. If  $a_1, \dots, a_n$  are positive numbers, define

arithmetic mean  $a_A = \frac{1}{n}(a_1 + a_2 + \dots + a_n)$ ; geometric mean  $a_G = [a_1 a_2 \dots a_n]^{\frac{1}{n}}$ ; harmonic mean  $a_H = \frac{1}{\frac{1}{n}(\frac{1}{a_1} + \frac{1}{a_2} + \dots + \frac{1}{a_n})}$

An inequality relating these means is  $a_H \leq a_G \leq a_A$

**Theorem 4.7.9 (Covariance Inequality)**

- If  $g(x)$  is a nondecreasing function and  $h(x)$  is a nonincreasing function, then  $E(g(X)h(X)) \leq (Eg(X))(Eh(X))$
- If  $g(x)$  and  $h(x)$  are either both nondecreasing or both nonincreasing, then  $E(g(X)h(X)) \geq (Eg(X))(Eh(X))$

### 4.E

4.E.40 Dirichlet distribution  $f(x, y) = Cx^{a-1}y^{b-1}(1-x-y)^{c-1}; 0 < x < 1, 0 < y < 1, 0 < 1-x-y < 1; c = \frac{\Gamma(a+b+c)}{\Gamma(a)\Gamma(b)\Gamma(c)}$ ;  $X, Y \sim \text{Beta}, Y/(1-x) \sim \text{Beta}(b, c)$ ;  $E(XY) = \frac{ab}{(a+b+c+1)(a+b+c)}$

## 5. Properties of a Random Sample

### 5.1 Basic Concepts of Random Samples

**Definition 5.1.1** The random variables  $X_1, \dots, X_n$  are called a random sample of size  $n$  from the population  $f(x)$  if  $X_1, \dots, X_n$  are mutually independent random variables and the marginal pdf or pmf of each  $X_i$  is the same function  $f(x)$ . Alternatively,  $X_1, \dots, X_n$  are called independent and identically distributed random variables with pdf or pmf  $f(x)$ . This is commonly abbreviated to *iid* random variables.  $f(x_1, \dots, x_n) = f(x_1) \dots f(x_n) = \prod_{i=1}^n f(x_i)$

### 5.2 Sums of Random Variables from a Random Sample

**Definition 5.2.1** Let  $X_1, \dots, X_n$  be a random sample of size  $n$  from a population and let  $T(x_1, \dots, x_n)$  be a real-valued or vector-valued function whose domain includes the sample space of  $(X_1, \dots, X_n)$ . Then the random variable or random vector  $Y = T(X_1, \dots, X_n)$  is called a statistic. The probability distribution of a statistic  $Y$  is called the sampling distribution of  $Y$ .

**Definition 5.2.2** The sample mean is the arithmetic average of the values in a random sample. It is usually denoted by  $\bar{X} = \frac{X_1 + \dots + X_n}{n} = \frac{1}{n} \sum_{i=1}^n X_i$

**Definition 5.2.3** The sample variance is the statistic defined by  $S^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2 = \frac{1}{n-1} (\sum_{i=1}^n X_i^2 - n\bar{X}^2)$

The sample standard deviation is the statistic defined by  $S = \sqrt{S^2}$

**Theorem 5.2.4 a.**  $\sum_{i=1}^n (X_i - a)^2$  is minimized when  $a = \bar{x}$

**Proof**

Let  $g(a) = \sum_{i=1}^n (X_i - a)^2$ , set

$$g'(a) = \sum_{i=1}^n 2(X_i - a)(-1) = 0 \implies a = \frac{1}{n} \sum_{i=1}^n X_i = \bar{x}$$

$$(n-1)s^2 = \sum_{i=1}^n (x_i - \bar{x})^2 = \sum_{i=1}^n x_i^2 - n\bar{x}^2$$

**Lemma 5.2.5 (5.2.1)**  $E[\sum_{i=1}^n g(X_i)] = nE(g(X_1))$  (5.2.1) is true for any collection of  $n$  identically distributed random variables.  $V[\sum_{i=1}^n g(X_i)] = n\text{Var}(g(X_1))$

**Theorem 5.2.6**

$$E\bar{X} = \mu; \text{Var}\bar{X} = \frac{\sigma^2}{n}; ES^2 = \sigma^2$$

**Theorem 5.2.7 mgf of the sample mean**  $M_{\bar{X}}(t) = [M_X(\frac{t}{n})]^n$

**Example 5.2.8 (Distribution of the mean)** Let  $X_1, \dots, X_n$  be a random sample from a  $n(\mu, \sigma^2)$  population. Then the mgf of the sample mean is

$$M_{\bar{X}}(t) = \left[ e^{\mu \frac{t}{n} + \frac{\sigma^2 (\frac{t}{n})^2}{2}} \right]^n = e^{\mu t + \frac{(\sigma^2/n)t^2}{2}}$$

Thus,  $\bar{X}$  has a  $n(\mu, \frac{\sigma^2}{n})$  distribution.

Another simple example is given by a  $\text{Gamma}(\alpha, \beta)$  random sample (4.6.8). Here, we can also easily derive the distribution of the sample mean. The mgf of the sample mean is

$$M_{\bar{X}}(t) = \left[ \left( \frac{1}{1 - \beta(\frac{t}{n})} \right)^a \right]^n = \left( \frac{1}{1 - \beta(\frac{t}{n})} \right)^{na}$$

which we recognize as the mgf of a  $g\text{Gamma}(n\alpha, \beta/n)$ , the distribution of  $\bar{X}$ .

$$\mu_{\bar{X}} = n\alpha \cdot \frac{\beta}{n} = \alpha\beta = \mu$$

$$\sigma_{\bar{X}}^2 = n\alpha \cdot \left( \frac{\beta}{n} \right)^2 = \frac{\alpha\beta^2}{n} = \frac{\sigma^2}{n}$$

**Theorem 5.2.9 Convolution formula** If  $X$  and  $Y$  are independent continuous random variables with pdfs  $f_X(x)$  and  $f_Y(y)$ , then the pdf of  $Z = X + Y$  is  $f_Z(z) = \int_{-\infty}^{\infty} f_X(w)f_Y(z-w)dw$

$$Z = X - Y \text{ is } f_Z(z) = \int_{-\infty}^{\infty} f_X(w)f_Y(w-z)dw$$

$$Z = XY \text{ is } f_Z(z) = \int_{-\infty}^{\infty} \frac{1}{w} f_X(w)f_Y\left(\frac{z}{w}\right)dw$$

$$Z = \frac{X}{Y} \text{ is } f_Z(z) = \int_{-\infty}^{\infty} \frac{w}{z^2} f_X(w)f_Y\left(\frac{w}{z}\right)dw$$

**Example 5.2.10 (Sum of Cauchy random variables)**

$X \sim \text{Cauchy}(0, \sigma)$ ,  $Y \sim \text{Cauchy}(0, \tau)$   $X + Y \sim \text{Cauchy}(0, \sigma + \tau)$

$X_1, \dots, X_n \sim \text{Cauchy}(0, \sigma)$   $\bar{X} \sim \text{Cauchy}(0, \sigma)$ ,  $\sum_{i=1}^n X_i \sim \text{Cauchy}(0, n\sigma)$

**Theorem 5.2.11** exponential family

**Example 5.2.12** (Sum of Bernoulli random variables)

## 5.3 Sampling from the Normal Distribution

### 5.3.1 Properties of the Sample Mean and Variance

**Theorem [5.3.1]** Let  $X_1, \dots, X_n$  be a random sample from a  $n(\mu, \sigma^2)$  distribution, and let  $\bar{X} = (1/n) \sum_{i=1}^n X_i$  and  $S^2 = [1/(n-1)] \sum_{i=1}^n (X_i - \bar{X})^2$  Then

$$\bar{X} \perp \sigma^2; \bar{X} \sim n(\mu, \sigma^2/n); \frac{(n-1)S^2}{\sigma^2} \sim \chi_{n-1}^2$$

$$f_{\chi^2}(x) = \frac{1}{\Gamma(\frac{n}{2})2^{\frac{n}{2}}} x^{\frac{n}{2}-1} e^{-\frac{x}{2}}, x > 0$$

$$nS_{n+1}^2 = (n-1)S_n^2 + \left(\frac{n}{n+1}\right)(X_{n+1} - \bar{X}_n)^2$$

$$\bar{X}_{n+1} = \frac{\sum_{i=1}^{n+1} X_i}{n+1} = \frac{\sum_{i=1}^n X_i + X_{n+1}}{n+1} = \frac{n\bar{X}_n + X_{n+1}}{n+1}$$

### 5.3.2 The Derived Distributions: Student's t and Snedecor's F {#T}

$$X \sim n(\mu, \sigma^2) \frac{x-\mu}{\sigma}, \frac{\bar{x}-\mu}{\sigma/\sqrt{n}} \sim n(0, 1) \frac{\bar{X}-\mu}{S/\sqrt{n}} = \frac{\frac{\bar{x}-\mu}{\sigma/\sqrt{n}}}{\sqrt{S^2/\sigma^2}} = \frac{U}{\sqrt{\frac{\chi_{n-1}^2}{n-1}}} \sim t_{n-1}$$

$$t_1 = \text{Cauchy}(0, 1)$$

$$x_i \sim n(0, 1), \sum_{i=1}^n x_i^2 \sim \chi_n^2, x_i \sim n(0, \sigma^2), \sum_{i=1}^n x_i^2 \sim \sigma^2 \chi_n^2, \sum_{i=1}^n (x_i - \bar{x})^2 \sim \sigma^2 \chi_{n-1}^2$$

$$\chi_2^2 \Leftrightarrow \text{Expo}(2) \chi_p^2 \sim \text{Gamma}\left(\frac{p}{2}, 2\right) X_1, \dots, X_n \sim \chi_{p_i}^2, X_1 + \dots + X_n \sim$$

$$\chi^2_{p_1+...+p_n} \quad U \sim \chi^2_m, V \sim \chi^2_n, U+V \sim \chi^2_{m+n}$$

$$\textbf{Definition 5.3.4} \; f_T(x) = \frac{\Gamma(\frac{p+1}{2})}{\Gamma(\frac{p}{2})\sqrt{p\pi}} \left(1 + \frac{x^2}{p}\right)^{-\frac{p+1}{2}}, -\infty < x < \infty$$

$$5.3.5 \; X_i \sim n(\mu_X, \sigma_X^2), Y_j \sim n(\mu_Y, \sigma_Y^2), X_1..X_n \perp Y_1..Y_m, \frac{S_X^2}{\sigma_X^2} \sim \chi^2_{\frac{S_Y^2}{\sigma_Y^2}} \sim F$$

$$V\chi^2_{n-1} = V[\frac{(n-1)S^2}{\sigma^2}] = \frac{(n-1)^2}{\sigma^4}Var[S^2] = 2(n-1) \implies Var[S^2] = \frac{2\sigma^4}{n-1}$$

$$\textbf{Definition 5.3.6} \; f_F(x) = \frac{\Gamma(\frac{p+q}{2})}{\Gamma(\frac{p}{2})\Gamma(\frac{q}{2})}(\frac{p}{q})^{\frac{p}{2}}\frac{x^{\frac{p}{2}-1}}{(1+\frac{p}{q}x)^{\frac{p+q}{2}}}, x > 0$$

$$\textbf{Theorem 5.3.8}$$

$$X \sim F(p,q), \frac{1}{X} \sim F(q,p);$$

$$X \sim T(q), X^2 \sim F(1,q)$$

$$X \sim F(p,q), \frac{\frac{p}{q}X}{1+\frac{p}{q}X} \sim Beta(\frac{p}{2}, \frac{q}{2})$$

## 5.4 Order Statistics {#order} {#range} {#median}

**Definition 5.4.1** The order statistics  
**Definition 5.4.2** The notation  $\{b\}$ , when appearing in a subscript, is defined to be the number  $b$  rounded to the nearest integer in the usual way. More precisely, if  $i$  is an integer and  $i-.5 \leq b < i+.5$ , then  $\{b\} = i$ .

**Theorem 5.4.3** Let  $X_1, ..., X_n$  be a random sample from a discrete distribution with pmf  $f_X(x_i) = P_i$ , where  $x_1 < x_2 < ..$  are the possible values of  $X$  in ascending order.  
Let  $X_{(1)}, ..., X_{(n)}$  denote the order statistics from the sample. Then

$$P(X_{(j)} \leq X_i) = \sum_{k=j}^n \binom{n}{k} P_i^k (1 - P_i)^{n-k}$$

$$P(X_{(j)} = X_i) = \sum_{k=j}^n \binom{n}{k} [P_i^k (1 - P_i)^{n-k} - P_{i-1}^k (1 - P_{i-1})^{n-k}]$$

**Theorem 5.4.4** 2019.01.29`p.9 Let  $X_{(1)}, ..., X_{(n)}$  denote the order statistics of a random sample,  $X_1, ..., X_n$  from a continuous population with cdf  $F_X(x)$  and pdf  $f_X(x)$ . Then the pdf of  $X_{(n)}$  is

$$(5.4.4) \quad f_{X_{(j)}}(x) = \frac{n!f_X(x)}{(j-1)!(n-j)!} [F_X(x)]^{j-1} [1 - F_X(x)]^{n-j}$$

$$f_k(x) = k \binom{n}{k} [F(x)]^{k-1} [1 - F(x)]^{n-k}$$

**Example 5.4.5 (Uniform order statistic pdf)** Let  $X_{(1)}, ..., X_{(n)}$  be iid  $Unif(0,1)$ , so  $f_X(x) = 1$  for  $x \in (0,1)$  and  $F_X(x) = x$  for  $x \in (0,1)$ . Using (5.4.4), we see that the pdf of the  $j^{th}$  order statistic is

$$f_{X_{(j)}}(x) = \frac{n!}{(j-1)!(n-j)!} x^{j-1} (1-x)^{n-j} = \frac{\Gamma(n+1)}{\Gamma(j)\Gamma(n-j+1)} x^{j-1} (1-x)^{n-j+1-1}$$

$$EX_{(j)} = \frac{j}{n+1}, VarX_{(j)} = \frac{j(n-j+1)}{(n+1)^2(n+2)}$$

$$\textbf{Theorem 5.4.6}$$

$$f_{X_{(i)}, X_{(j)}}(u, v) = \frac{n!f_X(u)f_X(v)}{(i-1)!(j-1-i)!(n-j)!} [F_X(u)]^{i-1} [F_X(v) - F_X(u)]^{j-1-i} [1 - F_X(v)]^{n-j}, -\infty < u < v < \infty$$

**Example 5.4.7 (Distribution of the midrange and range)**

## 5.5 Convergence Concepts

### 5.5.1 Convergence in Probability

**Definition 5.5.1** A sequence of random variables,  $X_1, X_2, ..., \xrightarrow{P} X$  if, for every  $\epsilon > 0$ ,  

$$\begin{cases} \lim_{n \rightarrow \infty} P(|X_n - X| \geq \epsilon) = 0 \\ \lim_{n \rightarrow \infty} P(|X_n - X| < \epsilon) = 1 \end{cases}$$

**Theorem 5.5.2 (Weak Law of Large Numbers)** Let  $X_1, X_2, ..$  be iid random variables with  $EX_i = \mu$  and  $VarXi = \sigma^2 < \infty$ . Define  $\bar{X}_n = \frac{1}{n} \sum_{i=1}^n X_i$  Then, for every  $\epsilon > 0 \lim_{n \rightarrow \infty} P(|\bar{X}_n - \mu| < \epsilon) = 1$  that is,  $\bar{X}_n$  converges in probability to  $\mu$ .

**Example 5.5.3 (Consistency of  $S^2$ )** Suppose we have a sequence  $X_1, X_2, ..$  of iid random variables with  $EX_i = \mu$  and  $VarXi = \sigma^2 < \infty$ . If we define  $S_n^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2$  a sufficient condition that  $VarS_n^2$  converges in probability to  $\sigma^2$  is that  $VarS_n^2 \rightarrow 0$  as  $n \rightarrow \infty$

**Theorem 5.5.4** Suppose that  $X_1, X_2, ..$  converges in probability to a random variable  $X$  and that  $h$  is a continuous function. Then  $h(X_1), h(X_2), ..$  converges in probability to  $h(X)$ .

**Example 5.5.5 (Consistency of  $S$ )** If  $S_n^2$  is a consistent estimator of  $\sigma^2$ , then by Theorem 5.5.4, the sample standard deviation  $S_n = \sqrt{S_n^2} = h(S_n^2)$  is a consistent estimator of  $\sigma$ . Note that  $S_n$  is, in fact, a biased estimator of  $\sigma$  (see Exercise 5.11), but the bias disappears asymptotically.

### 5.5.2 Almost Sure Convergence

**Definition 5.5.6** A sequence of random variables,  $X_1, X_2, ...,$  converges almost surely to a random variable  $X$  if, for every  $\epsilon > 0$ ,  $P(\lim_{n \rightarrow \infty} |X_n - X| < \epsilon) = 1$

**Example 5.5.7 (Almost sure convergence)**

**Example 5.5.8 (Convergence, not almost surely)**

**Theorem 5.5.9 (Strong Law of Large Numbers)** Let  $X_1, X_2, ..$  be iid random variables with  $EX_i = \mu$  and  $VarXi = \sigma^2 < \infty$ , and define  $\bar{X}_n = \frac{1}{n} \sum_{i=1}^n X_i$ . Then, for every  $\epsilon > 0$ ,  $P(\lim_{n \rightarrow \infty} |\bar{X}_n - \mu| < \epsilon) = 1$  that is,  $\bar{X}_n$  converges almost surely to  $\mu$

### 5.5.3

Convergence in Distribution {#Max-Unif} {#CLT}

**Definition 5.5.10** A sequence of random variables,  $X_1, X_2, ...,$  converges in distribution to a random variable  $X$  if  $\lim_{n \rightarrow \infty} F_{X_n}(x) = F_X(x)$  at all points  $x$  where  $F_X(x)$  is continuous.

**Example 5.5.11 (Maximum of uniforms)**

$$P(|y_{(n)} - 1| \geq \epsilon) = (1 - \epsilon)^n$$

$$P(y_{(n)} \leq 1 - t/n) = (1 - t/n)^n \rightarrow e^{-t}$$

$$P(y_{(n)} \leq 1 - t/n) = P(n(1 - y_n) \geq t) \rightarrow 1 - e^{-t}$$

**Theorem 5.5.12**

**Theorem 5.5.13**

**Theorem 5.5.14 (Central Limit Theorem)**

$$\frac{\sqrt{n}(\bar{X}_n - \mu)}{\sigma} \xrightarrow{D} N(0,1)$$

**Theorem 5.5.15 (Stronger form of the Central Limit Theorem)**

**Example 5.5.16 (Normal approximation to the negative binomial)**

$$\frac{\sqrt{n}(\bar{X}_n - \mu)}{S_n} \xrightarrow{D} N(0,1)$$

**Theorem 5.5.17 (Slutsky's Theorem)** If  $X_n \rightarrow X$  in distribution and  $Y_n \rightarrow a$ , a constant, in probability, then

- $Y_n X_n \rightarrow aX$  in distribution
- $X_n + Y_n \rightarrow X + a$  in distribution

### 5.5.4

The Delta Method {#DeltaM}

**Example 5.5.19 (Estimating the odds)**

**Definition 5.5.20**

**Theorem 5.5.21 (Taylor)**

**Example 5.5.22 (Continuation of Example 5.5.19)**

**Example 5.5.23 (Approximate mean and variance)**

$$g(\mu) = \frac{1}{\mu}, E_{\mu}(\frac{1}{X}) \approx \frac{1}{\mu}, Var_{\mu}(\frac{1}{X}) \approx (\frac{1}{\mu})^2 Var_{\mu}(X)$$

**Theorem 5.5.24 (Delta Method)**  $\sqrt{n}(Y_n - \theta) \xrightarrow{D} N(0, \sigma^2), g'(\theta) \neq 0$ ,

$$\sqrt{n}[g(Y_n) - g(\theta)] \xrightarrow{D} N(0, \sigma^2[g'(\theta)]^2)$$

**Example 5.5.25 (Continuation of Example 5.5.23)**

$$\sqrt{n}(\frac{1}{\bar{X}} - \frac{1}{\mu}) \xrightarrow{D} N(0, (\frac{1}{\mu})^4 Var_{\mu}[X_1])$$

$$\widehat{Var}[\frac{1}{\bar{X}}] \approx (\frac{1}{\bar{X}})^4 S^2,$$

$$\frac{\sqrt{n}(\frac{1}{\bar{X}} - \frac{1}{\mu})}{(\frac{1}{\bar{X}})^2 S} \xrightarrow{D} N(0,1)$$

**Theorem 5.5.26 (Second-order Delta Method)**

$$g'(\theta) = 0,$$

$$\sqrt{n}[g(Y_n) - g(\theta)] \xrightarrow{D} \sigma^2 \frac{g''(\theta)}{2} \chi_1^2)$$

**Example 5.5.27 (Moments of a ratio estimator)**

**Theorem 5.5.28 (Multivariate Delta Method)**

## 5.6 Generating a Random Sample

### 5.6.1 Direct Methods

**Example 5.6.1 (Exponential lifetime)**

**Example 5.6.2 (Continuation of Example 5.6.1)**

**Example 5.6.3 (Probability Integral Transform)**

The relationship between the exponential and other distributions allows the quick generation of many random variables. For example, if  $U_j$  are iid *uniform*(0,1) random variables, then  $Y_j = -\lambda \ln(u_j) \sim Expo(\lambda)$

$$Y = -2 \sum_{j=1}^v \ln U_j \sim \chi_{2v}^2$$

$$Y = -\beta \sum_{j=1}^{\alpha} \ln U_j \sim \text{Gamma}(\alpha, \beta)$$

$$Y = \frac{\sum_{j=1}^a \ln U_j}{\sum_{j=1}^{a+b} \ln U_j} \sim \text{Beta}(a, b)$$

**Example 5.6.5 (Binomial random variable generation)**

**Example 5.6.6 (Distribution of the Poisson variance)**

## 5.6.2 Indirect Methods

**Example 5.6.7 (Beta random variable generation-I)** generates a  $\text{Beta}(a, b)$  random variable.

## 5.6.3 The Accept/Reject Algorithm

**Example 5.6.8** (See HW7)

**Example 5.6.9 (Beta random variable generation-II)**

# 6. Principles of Data Reduction

## 6.2 The Sufficiency Principle

### 6.2.1

Sufficient Statistics {#suff} {#Facto}

**Definition 6.2.1** A statistic  $T(\mathbf{X})$  is a sufficient statistic for  $\theta$  if the conditional distribution of the sample  $\mathbf{X}$  given the value of  $T(\mathbf{X})$  does not depend on  $\theta$ .

**Theorem 6.2.2** If  $p(\mathbf{x}|\theta)$  is the joint pdf or pmf of  $\mathbf{X}$  and  $q(t|\theta)$  is the pdf or pmf of  $T(\mathbf{X})$ , then  $T(\mathbf{X})$  is a sufficient statistic for  $\theta$  if, for every  $\mathbf{x}$  in the sample space, the ratio  $p(\mathbf{x}|\theta)/q(T(\mathbf{X})|\theta)$  is constant as a function of  $\theta$ .

**Example 6.2.3 (Binomial sufficient statistic)**

**Example 6.2.4 (Normal sufficient statistic)**

**Example 6.2.5 (Sufficient order statistics)**

**Example 6.2.5 (Sufficient order statistics)** Let  $X_1, \dots, X_n$  be iid from a pdf  $f$ , where we are unable to specify any more information about the pdf (as is the case in nonparametric estimation). It then follows that the sample density is given by

$$f(\mathbf{x}|\theta) = \prod_{i=1}^n f(x_i) = \prod_{i=1}^n f(x_{(i)})$$

where  $x_{(1)} \leq x_{(2)} \leq \dots \leq x_{(n)}$  are the order statistics.

**Theorem 6.2.6 (Factorization Theorem)**

Let  $f(\mathbf{x}|\theta)$  denote the joint pdf or pmf of a sample  $\mathbf{X}$ . A statistic  $T(\mathbf{X})$  is a sufficient statistic for  $\theta$  if and only if there exist functions  $g(\mathbf{x}|\theta)$  and  $h(\mathbf{x})$  such that, for all sample points  $\mathbf{x}$  and all parameter points  $\theta$ ,

$$f(\mathbf{x}|\theta) = g(T(\mathbf{x})|\theta)h(\mathbf{x})$$

**Example 6.2.8 (Uniform sufficient statistic)**

**Example 6.2.9 (Normal sufficient statistic, both parameters unknown)**

**Theorem 6.2.10** exponential family  $T = \sum X_i$  is a sufficient statistic for  $\theta$ .

### 6.2.2

Minimal Sufficient Statistics {#Min-Suff}

**Definition 6.2.11** A sufficient statistic  $T(\mathbf{X})$  is called a minimal sufficient statistic if, for any other sufficient statistic  $T'(\mathbf{X})$ ,  $T(\mathbf{x})$  is a function of  $T'(\mathbf{X})$ .

**Definition 6.2.13** Let  $f(\mathbf{x}|\theta)$ , be the pmf or pdf of a sample  $\mathbf{X}$ . Suppose there exists a function  $T'(\mathbf{x})$  such that, for every two sample points  $\mathbf{x}$  and  $\mathbf{y}$ , the ratio  $\frac{f(\mathbf{x}|\theta)}{f(\mathbf{y}|\theta)}$  is constant as a function of  $\theta$  if and only if  $T(\mathbf{x}) = T(\mathbf{y})$ , then  $T(\mathbf{x})$  is a minimal sufficient statistic for  $\theta$ .

**Example 6.2.15** (Uniform minimal sufficient statistic)

## 6.2.3 Ancillary Statistics

**Definition 6.2.16** A statistic  $S(\mathbf{X})$  whose distribution does not depend on the parameter  $\theta$  is called an ancillary statistic.

**Example 6.2.18** (Location family ancillary statistic)

$R = \bar{X}_{(n)} - X_{(1)}$  is an ancillary statistic.

**Example 6.2.19 (Scale family ancillary statistic)** the  $(n-1)$  values  $X_1/X_n, \dots, X_{n-1}/X_n$  is an ancillary statistic.

### 6.2.4

Sufficient, Ancillary, and Complete Statistics {#comp} {#Basu}

**Definition 6.2.21** Let  $f(\mathbf{x}|\theta)$  be a family of pdfs or pmfs for a statistic  $T(\vec{X})$ . The family of probability distributions is called complete if  $E_{\theta}[g(T)] = 0, \forall \theta$  implies  $P_{\theta}(g(T) = 0) = 1$  for all  $\theta$ . Equivalently,  $T(\vec{X})$  is called a *complete statistic*.

**Example 6.2.22 (Binomial complete sufficient statistic)**  $T$  is a complete statistic.

**Example 6.2.23 (Uniform complete sufficient statistic)**  $T(\mathbf{X}) = \max_i X_i$  is a sufficient statistic.  $T$  is a complete statistic.

**Theorem 6.2.24 (Basu's Theorem)** If  $T(\mathbf{X})$  is a complete and minimal sufficient statistic, then  $T(\mathbf{X})$  is independent of every ancillary statistic.

**Theorem 6.2.25 (Complete statistics in the exponential family)** Let  $X_1, \dots, X_n$  be iid observations from an exponential family with pdf or pmf of the form  $f(\mathbf{x}|\vec{\theta}) = h(\mathbf{x})c(\vec{\theta})e^{\sum_{j=1}^k W_j(\vec{\theta})t_j(\mathbf{x})}$ , where  $\vec{\theta} = \theta_1, \dots, \theta_k$ . Then the statistic  $T(\mathbf{X}) = (\sum_{i=1}^n t_1(X_i), \dots, \sum_{i=1}^n t_k(X_i))$  is complete as long as the parameter space  $\Theta$  contains an open set in  $\mathbb{R}^k$ .

**Example 6.2.26 (Using Basu's Theorem-I)**

**Example 6.2.27 (Using Basu's Theorem-II)**

**Theorem 6.2.28** If a minimal sufficient statistic exists, then any complete statistic is also a minimal sufficient statistic.

## 6.3 The Likelihood Principle

### 6.3.1 The Likelihood Function

**Definition 6.3.1** likelihood function

**Example 6.3.2 (Negative binomial likelihood)**

**Example 6.3.3 (Normal fiducial distribution)**

### 6.3.2 The Formal Likelihood Principle

**Example 6.3.4 (Evidence function)**

**Example 6.3.5 (Binomial/negative binomial experiment)**

**Theorem 6.3.6 (Birnbbaum's Theorem)** The Formal Likelihood Principle follows from the Formal Sufficiency Principle and the Conditionality Principle. The converse is also true.

**Example 6.3.7 (Continuation of Example 6.3.5)**

## 6.4 The Equivariance Principle

**Example 6.4.1 (Binomial equivariance)**

**Definition 6.4.2** group of transformations

**Example 6.4.3 (Continuation of Example 6.4.1)**

**Definition 6.4.4** invariant under the group

**Example 6.4.5 (Conclusion of Example 6.4.1)**

**Example 6.4.6 (Normal location invariance)**

### 6.E.10

6.E.10 Show that the minimal sufficient statistic for the  $\text{Unif}(\theta, \theta + 1)$ , found in [Example 6.2.15], is not complete. 8.E.33 [562-HW5]

# 7. Point Estimation

## 7.2 Methods of Finding Estimators

### 7.2.1

Method of Moments {#MOM}

$f(\mathbf{x}|\theta) =$ . Thus,  $X \sim \text{Beta}(\theta, 1)$ ,  $\mu'_1 = E[X] =$

Set  $\bar{X} = \frac{1}{n} \sum_{i=1}^n X_i = \mu'_1 =$ . Therefore,  $\hat{\theta}_{\text{MOM}} =$

**Example 7.2.1 (Normal method of moments)**

**Example 7.2.2 (Binomial method of moments)**

**Example 7.2.3 (Satterthwaite approximation)**

### 7.2.2 Maximum Likelihood Estimators

$$L(\theta|\mathbf{x}) = L(\theta_1, \dots, \theta_k | x_1, \dots, x_n) = \prod_{i=1}^n f(x_i | \theta_1, \dots, \theta_k)$$

**Definition 7.2.4** For each sample point  $\vec{x}$ , let  $\hat{\theta}(\vec{x})$  be a parameter value at which  $L(\theta|\mathbf{x})$  attains its maximum as a function of  $\theta$ , with  $\vec{x}$  held fixed. A *maximum likelihood estimator* (MLE) of the parameter  $\theta$  based on a sample  $\vec{X}$  is  $\hat{\theta}(\vec{X})$ .

Let  $L(\theta|\mathbf{x}) = f(\mathbf{x}|\theta)$ .  $\forall \theta$ ,  $L(\theta|\mathbf{x}) =$ . Thus,  $\theta_{\text{MLE}} =$ .

Derive the log likelihood function.  $l(\theta|\mathbf{x}) = \ln L(\theta|\mathbf{x}) =$

Set  $\frac{\partial}{\partial \theta_i} l(\theta|\mathbf{x}) = 0, \quad i = 1, \dots, k$

Set  $\frac{\partial}{\partial^2 \theta_i} l(\theta|\mathbf{x}) = 0$ , there is solution or not.

Thus,  $\hat{\theta}_{MLE} =$

**Example 7.2.5 (Normal likelihood)**

**Example 7.2.6 (Continuation of Example 7.2.5)**

**Example 7.2.7 (Bernoulli MLE)**

**Example 7.2.8 (Restricted range MLE)**

**Example 7.2.9 (Binomial MLE, unknown number of trials)**

A useful property of maximum likelihood estimators is what has come to be known as the *invariance property of maximum likelihood estimators* (not to be confused with the type of invariance discussed in Chapter 6).

**Theorem 7.2.10 (Invariance property of MLEs)** If  $\hat{\theta}$  is the MLE of  $\theta$ , then for any function  $\tau(\theta)$ , the MLE of  $\tau(\theta)$  is  $\tau(\hat{\theta})$ .

**Example 7.2.11 (Normal MLEs,  $\mu$  and  $\sigma$  unknown)**

**Example 7.2.12 (Continuation of Example 1.2.11)**

**Example 7.2.13 (Continuation of Example 7.2.2)**

## 7.2.3

Bayes Estimators {#BayesE}

In the Bayesian approach  $\theta$  is considered to be a quantity whose variation can be described by a probability distribution (called the *prior distribution*). This is a subjective distribution, based on the experimenter's belief, and is formulated before the data are seen (hence the name prior distribution). A sample is then taken from a population indexed by  $\theta$  and the prior distribution is updated with this sample information. The updated prior is called the *posterior distribution*. This updating is done with the use of Bayes' Rule (seen in Chapter 1), hence the name Bayesian statistics.

If we denote the prior distribution by  $\pi(\theta)$  and the sampling distribution by  $f(\vec{x}|\theta)$ , then the posterior distribution, the conditional distribution of  $\theta$  given the sample,  $\vec{x}$ , is  $\pi(\theta|\vec{x}) = \frac{f(\vec{x}|\theta)\pi(\theta)}{m(\vec{x})}$ ,

$$f(\vec{x}|\theta)\pi(\theta) = f(\vec{x}, \theta), m(\vec{x}) = \int f(\vec{x}|\theta)\pi(\theta)d\theta$$

**Definition Bayes Estimator** of  $\theta$  [2019.2.26p10] is the value that minimizes  $E[\mathcal{L}_\theta(\hat{\theta}|\vec{x})]$  (Posterior risk)  $\mathcal{L}_\theta(\hat{\theta}) \geq 0$  is a loss function  $\mathcal{L}_\theta(\theta) = 0$

**Example Pois-Gamma** [2019.2.26p11]  $X \sim \text{Pois}(\theta), \theta \sim \text{Gamma}(\alpha, \beta)$  (known)

$$g(\vec{x}, \theta) = \pi(\theta) \prod f(x_i, \theta), m(\vec{x}) = \int g(\vec{x}, \theta)$$

$$\pi(\theta|\vec{x}) = \frac{g(\vec{x}, \theta)}{m(\vec{x})} \sim \text{Gamma}(\alpha + \sum x_i, \frac{\beta}{n\beta+1})$$

If  $\mathcal{L}_\theta(\hat{\theta}) = (\hat{\theta} - \theta)^2$ , Posterior risk  $E[\mathcal{L}_\theta(\hat{\theta}|\vec{x})]$  is minimized when  $\hat{\theta} = E[\theta|\vec{x}]$  (posterior mean)

$$\hat{\theta}_{L_2\text{Bayes}} = \frac{(\alpha + \sum x_i)\beta}{n\beta+1} = \frac{\alpha\beta}{n\beta+1} + \frac{n\bar{x}\beta}{n\beta+1} = \frac{1}{n\beta+1} + \frac{(\text{prior mean}) + n\beta\hat{\theta}_{MLE}}{n\beta+1}$$

If  $\mathcal{L}_\theta(\hat{\theta}) = |\hat{\theta} - \theta|$  (absolute error loss),  $\hat{\theta}_{L_1\text{Bayes}}$  is the posterior median.

If  $\mathcal{L}_\theta(\hat{\theta}) = \begin{cases} 0 & \hat{\theta} = \theta \\ 1 & \text{elsewhere} \end{cases}$  (binary loss),  $\hat{\theta}_{L_0\text{Bayes}}$  is the posterior mode.

This gives you an MAP(Maximum a posterior)

**Example Beta-Bino**  $X \sim \text{Bino}(n, \theta), \theta \sim \text{Beta}(\alpha, \beta)$  [2019.2.28] Example 4.4.6

$$\pi(\theta|\mathbf{x}) \propto \pi(\theta)L(\theta) \propto \theta^{\alpha-1+x}(1-\theta)^{\beta-1+n-x} \sim \text{Beta}(\alpha+x, \beta-n+x);$$

$$\hat{\theta}_{L_2\text{Bayes}} = \frac{\alpha+x}{\alpha+\beta+n} = \frac{\alpha+\beta}{\alpha+\beta+n} \left( \frac{\alpha}{\alpha+\beta} \right) + \frac{n}{\alpha+\beta+n} \left( \frac{X}{n} \right) = \frac{1}{n\beta+1} + \frac{(\alpha+\beta)(\text{prior mean}) + n\beta\hat{\theta}_{MLE}}{\alpha+\beta+n}$$

**Example 7.2.14 (Binomial Bayes estimation)**

**Definition 7.2.15** Let  $\mathcal{F}$  denote the class of pdfs or pmfs  $f(\vec{x}|\theta)$  (indexed by  $\theta$ ). A class  $\Pi$  of prior distributions is a *conjugate family* for  $\mathcal{F}$  if the posterior distribution is in the class  $\Pi \forall f \in \mathcal{F}$ , all priors in  $\Pi$ , and all  $x \in \mathcal{X}$ .

**Example 7.2.16 (Normal Bayes estimators)** Let  $X_1, \dots, X_n$  be a random sample from a  $n(\mu, \sigma^2)$  population, and suppose that the prior distribution on  $\theta$  is  $n(\mu, \tau^2)$ . Here we assume that  $\sigma^2, \mu, \tau^2$  are all known. The posterior distribution of  $\theta$  is also normal, with mean and variance given by

$$f(\theta|\mathbf{x}) \sim N\left(\frac{\tau^2 x + \sigma^2 \mu}{\tau^2 + \sigma^2}, \frac{\sigma^2 \tau^2}{\tau^2 + \sigma^2}\right), E(\theta|\mathbf{x}) = \frac{\tau^2}{\tau^2 + \sigma^2} x + \frac{\sigma^2}{\tau^2 + \sigma^2} \mu, \text{Var}(\theta|\mathbf{x}) = \frac{\sigma^2 \tau^2}{\tau^2 + \sigma^2}$$

## 7.2.4 The EM Algorithm

(Expectation-Maximization)

**Example 7.2.17 (Multiple Poisson rates)**

**Example 7.2.18 (Continuation of Example 7.2.17)**

**Example 7.2.19 (Conclusion of Example 7.2.17)**

**Theorem 7.2.20 (Monotonic EM sequence)** The sequence  $\{\hat{\theta}_{(r)}\}$  defined by 7.2.20 satisfies  $L(\hat{\theta}_{(r+1)}|\mathbf{y}) \geq L(\hat{\theta}_{(r)}|\mathbf{y})$

## 7.3 Methods of Evaluating Estimators

### 7.3.1

Mean Squared Error {#MSE} {#bias} {#unbias}

**Definition 7.3.1** The mean squared error (MSE) of an estimator  $W$  of a parameter  $\theta$  is the function of  $\theta$  defined by  $E_\theta(W - \theta)^2$ .

$$E_\theta(W - \theta)^2 = \text{Var}_\theta W + (E_\theta W - \theta)^2 = \text{Var}_\theta W + (\text{Bias}_\theta W)^2$$

**Definition 7.3.2** The *bias* of a point estimator  $W$  of a parameter  $\theta$  is the difference between the expected value of  $W$  and  $\theta$ ; that is,  $\text{Bias}_\theta W = E_\theta W - \theta$ . An estimator whose bias is identically (in  $\theta$ ) equal to 0 is called *unbiased* and satisfies  $E_\theta W = \theta$  for all  $\theta$ .

For an unbiased estimator we have  $E_\theta(W - \theta)^2 = \text{Var}_\theta W$  and so, if an estimator is unbiased, its MSE is equal to its variance.

**Example 7.3.3 (Normal MSE)** Let  $X_1, \dots, X_n \sim \text{iid } n(\mu, \sigma^2)$ . The statistics  $\bar{X}$  and  $\sigma^2$  are both unbiased estimators since  $E\bar{X} = \mu, \quad E\sigma^2 = \sigma^2, \forall \mu$  and  $\sigma^2$

$$E(\bar{X} - \mu)^2 = \text{Var}\bar{X} = \frac{\sigma^2}{n}, \quad E(\sigma^2 - \sigma^2)^2 = \text{Var}\sigma^2 = \frac{2\sigma^4}{n-1}$$

**Example 7.3.4 (Continuation of Example 7.3.3)** An alternative estimator for  $\sigma^2$  is the maximum likelihood estimator

$$\hat{\sigma}^2 = \frac{1}{n} \sum_{i=1}^n (X_i - \bar{X})^2 = \frac{n-1}{n} S^2. \text{ It is straightforward to calculate}$$

$$E\hat{\sigma}^2 = E\left(\frac{n-1}{n} S^2\right) = \frac{n-1}{n} \sigma^2 \text{ so } \sigma^2 \text{ is a biased estimator of } \hat{\sigma}^2.$$

$$\text{The variance of } \hat{\sigma}^2 \text{ can also be calculated as } \text{Var}\hat{\sigma}^2 = \text{Var}\left(\frac{n-1}{n} S^2\right) = \left(\frac{n-1}{n}\right)^2 \text{Var}S^2 = \frac{2(n-1)}{n^2} \sigma^4$$

$$\text{and, hence, its MSE is given by } E(\hat{\sigma}^2 - \sigma^2)^2 = \frac{2(n-1)}{n^2} \sigma^4 + \left(\frac{n-1}{n} \sigma^2 - \sigma^2\right)^2 = \frac{2n-1}{n^2} \sigma^4$$

We thus have  $E(\hat{\sigma}^2 - \sigma^2)^2 = \frac{2n-1}{n^2} \sigma^4 < \frac{2\sigma^4}{n-1} = E(S^2 - \sigma^2)^2$  showing that  $\hat{\sigma}^2$  has smaller MSE than  $S^2$

Thus, by trading off variance for bias, the MSE is improved.

**Example 7.3.5 (MSE of binomial Bayes estimator)**

**Example 7.3.6 (MSE of equivariant estimators)** Let  $X_1, \dots, X_n$  be iid  $f(x - \theta)$ . For an estimator  $W(X_1, \dots, X_n)$  to satisfy  $W(g_a(x)) = g_a(W(x))$ , we must have (7.3.2)  $W(x_1, \dots, x_n) + a = W(x_1 + a, \dots, x_n + a)$  which specifies the equivariant estimators with respect to the group of transformations defined by  $\mathcal{G} = \{g_a(\vec{x}) : -\infty < a < \infty\}$ , where  $g_a(x_1, \dots, x_n) = (x_1 + a, \dots, x_n + a)$ .

For these estimators we have (7.3.3)  $E_\theta(W(X_1, \dots, X_n) - \theta)^2 = \int \dots \int_{-\infty}^{\infty} (W(u_1, \dots, u_n))^2 \prod_{i=1}^n f(u_i) du_i$

### 7.3.2

Best Unbiased Estimators {#UMVUE} {#CRLB} {#FishI}

**Definition 7.3.7** An estimator  $W^*$  is a best unbiased estimator of  $\tau(\theta)$  if it satisfies  $E_\theta W^* = \tau(\theta)$  for all  $\theta$  and, for any other estimator  $W$  with  $E_\theta W = \tau(\theta)$ , we have  $\text{Var}_\theta W^* < \text{Var}_\theta W$  for all  $\theta$ .  $W^*$  is also called a *uniform minimum variance unbiased estimator* (UMVUE) of  $\tau(\theta)$ .

**Example 7.3.8 (Poisson unbiased estimation)**  $E_\lambda \bar{X} = \lambda = E_\lambda S^2, \forall \lambda$  are both unbiased estimator of  $\lambda$   
 $\text{Var}_\lambda \bar{X} \leq \text{Var}_\lambda S^2, \forall \lambda. \bar{X}$  is better

**Theorem 7.3.9 (Cramer-Rao Inequality)** Let  $X_1, \dots, X_n$  be a sample with pdf  $f(\vec{x}|\theta)$ , and let  $W(\vec{X}) = W(X_1, \dots, X_n)$  be any estimator satisfying

$$\frac{d}{d\theta} E_\theta W(\vec{X}) = \int_{\mathcal{X}} \frac{\partial}{\partial \theta} [W(\vec{x})f(\vec{x}|\theta)] d\vec{x}, \quad \text{Var}_\theta W(\vec{X}) < \infty$$

$$\text{Var}_\theta W(\vec{X}) \geq \frac{\left(\frac{d}{d\theta} E_\theta W(\vec{X})\right)^2}{E_\theta \left[\left(\frac{\partial}{\partial \theta} \ln f(\vec{X}|\theta)\right)^2\right]}$$

**Corollary 7.3.10 (Cramer-Rao Inequality, iid case)**

$$\text{Var}_\theta W(\vec{X}) \geq \frac{\left(\frac{d}{d\theta} E_\theta W(\vec{X})\right)^2}{n E_\theta \left[\left(\frac{\partial}{\partial \theta} \ln f(X|\theta)\right)^2\right]}$$

**Lemma 7.3.11 Fisher information** If  $f(x|\theta)$  satisfies

$\frac{d}{d\theta} E_{\theta} \left[ \frac{\partial}{\partial \theta} \ln f(X|\theta) \right] = \int \frac{\partial}{\partial \theta} \left( \left[ \frac{\partial}{\partial \theta} \ln f(x|\theta) \right] f(x|\theta) \right) dx$  (true for an exponential family), then

$$E_{\theta} \left[ \left( \frac{\partial}{\partial \theta} \ln f(X|\theta) \right)^2 \right] = -E_{\theta} \left[ \frac{\partial^2}{\partial \theta^2} \ln f(X|\theta) \right]$$

**Example 7.3.12 ( Conclusion of Example 7.3.8)**  $Var_{\lambda} W \geq \frac{\lambda}{n} = Var_{\lambda} \bar{X}$ .  $\bar{X}$  is a best unbiased estimator of  $\lambda$

**Example 7.3.13 (Unbiased estimator for the scale uniform)**

$$f(x|\theta) = \frac{1}{\theta}, I_{\theta} = \frac{1}{\theta^2}, CRLB Var_{\theta} W \geq \frac{\theta^2}{n}$$

The sufficient statistic  $Y = \max(X_1, \dots, X_n)$ .  $f_Y(y|\theta) = \frac{n}{\theta^n} y^{n-1}$

$$E_{\theta} Y = \int_0^{\theta} \frac{ny^n}{\theta^n} dy = \frac{n}{n+1} \theta, \frac{n+1}{n} Y \text{ is an unbiased estimator of } \theta$$

$$Var_{\theta} \frac{n+1}{n} Y = \frac{\theta^2}{n(n+2)} < \frac{\theta^2}{n}$$

This indicates that the CRLB is not applicable to this pdf.

**Example 7.3.14 (Normal variance bound)**  $Var[W|\mu, \sigma^2] \geq \frac{2\sigma^4}{n}$

Example 7.3.3 shows  $Var[S^2|\mu, \sigma^2] \geq \frac{2\sigma^4}{n-1}$ .  $S^2$  does not attain the CRLB

**Corollary 7.3.15 (Attainment)** Let  $X_1, \dots, X_n$  be iid  $f(x|\theta)$ , where  $f(x|\theta)$  satisfies the conditions of the Cramer-Rao Theorem. Let  $L(\theta|x) = \prod f(x_i|\theta)$  denote the likelihood function. If  $W(X) = W(X_1, \dots, X_n)$  is any unbiased estimator of  $\tau(\theta)$ , then  $W(X)$  attains the Cramer-Rao Lower Bound if and only if  $a(\theta)[W(x) - \tau(\theta)] = \frac{\partial}{\partial \theta} \ln L(\theta|x)$  for some function  $a(\theta)$ .

**Example 7.3.16 (Continuation of Example 7.3.14)**

$$\frac{\partial}{\partial \sigma^2} \ln L(\mu, \sigma^2|x) = \frac{n}{2\sigma^4} \left[ \frac{\sum (x_i - \mu)^2}{n} - \sigma^2 \right]$$

Thus, taking  $a(\sigma^2) = n/(2\sigma^4)$  shows that the best unbiased estimator of  $\sigma^2$  is  $\sum (x_i - \mu)^2/n$ , which is calculable only if  $\mu$  is known. If  $\mu$  is unknown, the bound cannot be attained.

## 7.3.3

Sufficiency and Unbiasedness {#Rao-Bla} {#Lehm-Sche}

**Theorem 7.3.17 (Rao-Blackwell)** Let  $W$  be any unbiased estimator of  $\tau(\theta)$ , and let  $T$  be a sufficient statistic for  $\theta$ . Define  $\phi(T) = E[W|T]$ . Then  $E_{\theta} \phi(T) = \tau(\theta)$  and  $Var_{\theta} \phi(T) \leq Var_{\theta}(W)$  for all  $\theta$ ; that is,  $\phi(T)$  is a uniformly better unbiased estimator of  $\tau(\theta)$ .

**Theorem 7.3.23 Lehmann-Scheffe** Let  $T$  be a complete sufficient statistic for a parameter  $\theta$ , and let  $\phi(T)$  be any estimator based only on  $T$ . Then  $\phi(T)$  is the unique best unbiased estimator of its expected value.

## 7.3.4 Loss Function Optimality

Our evaluations of point estimators have been based on their mean squared error performance. Mean squared error is a special case of a function called a *loss function*. The study of the performance, and the optimality, of estimators evaluated through loss functions is a branch of *decision theory*.

The loss function is a nonnegative function that generally increases as the distance between  $a$  and  $\theta$  increases. If  $\theta$  is real-valued, two commonly used loss functions are

absolute error loss  $L(\theta, a) = |a - \theta|$

squared error loss  $L(\theta, a) = (a - \theta)^2$

Linear-Exponential loss  $E7.65 L(\theta, a) = e^{c(a-\theta)} - c(a - \theta) - 1$

binary loss -8.3.5-  $L(\theta, a_0) = \begin{cases} 0 & \theta \in \Theta_0^c \\ 1 & \theta \in \Theta_0^c \end{cases} L(\theta, a_1) = \begin{cases} 1 & \theta \in \Theta_0 \\ 0 & \theta \in \Theta_0^c \end{cases}$

CI -9.3.4-  $L(\theta, C) = b \text{Length}(C) - I_C(\theta)$

where  $c$  is a positive constant. As the constant  $c$  varies, the loss function varies from very asymmetric to almost symmetric.

**Example 7.3.25 (Binomial risk functions)**
